BALUCHI, bá-lōō'chē, or **BELOOCHE**. A modern Iranian dialect, with many foreign loan-words from the Persian, Arabic, Turkish, and Sindhi. The Baluchi is divided into two main dialects, one of which, the southern or Makrani, has preserved many of the older features of the language with less change than is the case with the northern Baluchi, which, however, possesses the better-known literature. The Baluchi is far inferior to the Afghan (q.v.) in literary development. On the other hand, it represents in its consonantal system by far the oldest stage of any of the modern Iranian dialects, being in this regard on the same level as the Middle Persian or Pahlavi (q.v.). Thus the Persian changes *rd*, *rz* to *l*, while Baluchi preserves the original sounds: Persian *dil* (heart), Baluchi *zirdē* (cf. Russian *serdtse*, Lat. *cordis*); original *dj* is preserved, whereas it becomes *z* in Persian: Bal. *djan* (wife) = Pers. *zan*. Baluchi is seen to be equally conservative in that it does not change, as does the Persian, medial and final surds to sonants: Bal. *šap* (night) = Pers. *šab*, etc. The ruling race of Baluchistan, the Brahui (q.v.) speak a language which is entirely different from the Baluchi, being of Dravidian origin. Consult: Geiger, "Sprache der Balutschen," in Geiger and Kuhn, *Grundriss der iranischen Philologie* (Strassburg, 1898), and the literature there cited. Longworth-Dames, *Popular Poetry of the Baloches* (Folklore Soc. publications, London, 1907).

BALUCHISTAN, bá-lōō'chē-stān', or **BELUCHISTAN**, be-lōō' (Pers. *stan*, district, region, of the Baluchis). A British dependency in Asia, bounded by Afghanistan, on the north, Sindh (British India) on the east, the Arabian Sea on the south, and Persia on the west (Map: Asia, Central, K 6). It extends from lat. 25° to 32° N., and from long. 61° to about 70° 30' E., and covers an estimated area of 134,650 square miles, including the territory directly or indirectly held by Great Britain.

Description. The general appearance of the surface is rugged and uninviting. The chief mountain ranges enter from Afghanistan, through the northeastern end, and branch out towards the south and the west. Parallel to the eastern frontier runs the Kirthar Range, terminating at Cape Monzen, on the Arabian Sea. The level country found mainly in the north-west consists of stony plains. The highest peaks have an altitude ranging from 10,000 to 12,000 feet. The coast line, having a total length of about 600 miles, is mostly elevated and very little indented. It is without any harbors, but has a few roadsteads, the most important of which are Ormarah and Gwadur. The rivers of Baluchistan are generally short and flow in a direction from north to south. Very few of them, however, reach the coast, as their scanty waters are either diverted for irrigation purposes or are absorbed by the sandy soil. The chief of them are the Bolan and the Mula in the north, the Purali and the Hingol in the south, the latter entering the sea, and the Dasht at the south-western end, also discharging into the Arabian Sea. The climate varies greatly with the formation of the surface. The winters are generally severe, and snow is found even in the valleys. The summers are excessively hot, especially on the coast.

Industries. The cultivable area in comparison with the total area is small; for, excepting the plains of Kachhi, Las Bela, and the Dasht in Makran, cultivation is confined to limited areas in the middle of the valleys between the mountains. Grains, cotton, indigo, and all kinds of southern fruit are cultivated in several parts of the country, and the date palm grows in abundance in Makran. Land available for grazing purposes is found in some localities, and camels, sheep, and horses are reared. The mineral deposits are numerous and include gold, silver, copper, iron, zinc, saltpetre, and different kinds of salts. Manufacturing industries are practically non-existent; the principal products are rough blankets. The chief exports are wool, hides, dried fruit, madder, and tobacco. Transportation is effected chiefly by camels and the Sindh-Pishin Railway. There are about 550 miles of railway, and more are under construction. The town of Quetta in northwest Baluchistan is one of its important centres and is fast acquiring prominence as the western terminus of the Indian railway system.

Government, etc. Baluchistan consists of British Baluchistan (districts and administered territories), administered by a chief commissioner under the Governor-General of India; the native state of Kalat, governed by a khan under the control of a British political agent; the native state of Las Bela, governed by a jam, who is also controlled by the political agent; and tribal areas. British territory consists of the districts of Quetta Pishin, Loralai, Zhob, Bolan, Chagai, and Sibi; capital, Quetta; area, 46,960 square miles; pop. (1911), 414,412. The area of Kalat is stated at 73,278 square miles; capital, Kalat. Las Bela has 7132 square miles, and the tribal areas 7268 square miles. The total area of the native states is therefore 87,678 square miles; pop. (1911), 396,432; total Baluchistan, 134,638 square miles; pop., 810,844 (of whom 758,761 are Mohammedan). The two principal tribes are the Baluchis and the Brahuīs.

Ethnography. The Baluchis, or Biloch, after

whom Baluchistan is named, are, like the Afghans, an Aryan people, with Indic and Iranic linguistic affinities, perhaps more of the latter. Some Arab, Turk, and Negro blood also exists in some of the Baluchis. They are physically above the average, largely nomadic, and present some of the best and some of the worst characteristics of partly civilized races. In physical constitution, dress, and mental disposition they are distinguished from the Brahuic, who seem to have come earlier into the country. Both peoples are followers of Islam, professing the Sunnite creed, and the various tribes still lead a semi-independent life. Less important peoples in Baluchistan are the Persian Dehwars, or "villagers," the Gypsy-like Luris, and the Mekranis of the coast, who are considerably mixed in race. For more recent information consult Oliver, *Across the Border, Pathan and Biloch* (London, 1890), Dames, *Popular Poetry of the Baloches* (London, 1907), and other works.

History. Baluchistan, which is first mentioned by the historians of Alexander the Great under the name of Gedrosia, was ruled from early times to the end of the seventeenth century by a line of Hindu princes. Hard pressed by the mountain tribes of the interior, the Hindu rulers summoned to their aid the Brahuic, under their leader Kumbar, who subdued the predatory tribes and then made themselves masters of the country. The descendants of Kumbar established themselves firmly in power and were confirmed in their authority by the celebrated Nadir Shah, ruler of Persia, who overran the region on his expedition into India in 1739. Under the energetic Nasir Khan (1739-95), the supremacy of the Khan of Khelat was successfully asserted over the numerous tribal chiefs. British influence in Baluchistan dates from 1839, when, in reprisal for the khan's hostile conduct, Khelat was stormed by General Willshire. By a treaty of alliance concluded between Nasir Khan II and Great Britain in 1854, that ruler, in return for an annual subsidy of 50,000 rupees, later increased to 100,000, conceded to the British the right of armed intervention in any part of his territory—an exercise of power which the British government carried to the extent of forcing the resignation of the ruler of Khelat, Mir Mahmud Khan, in 1893. Since that date Baluchistan has come more and more under British influence, a large section of the country being now under the direct control of a British agency. Consult: Macgregor, *Wanderings in Balochistan* (London, 1882); Mückler, "Origin of the Baloch," in *Asiatic Journal* (Calcutta, 1896); Noctling, "Ueber prähistorische Niederlassungen in Baluchistan," in *Zeitschrift für Anthropologie und Ethnologie* (Berlin, 1899); Bellew, *Races of Afghanistan* (London, 1880). Consult also the *Proceedings* of the Royal Geographical and the Royal Asiatic societies.

BALUCKI, bā-lūts'kē, MICHAŁ (1837-1901). A popular Polish novelist and playwright. Born at Cracow, he studied at its gymnasium and university, being graduated from the latter in 1861. While still at the university he attracted considerable attention by his verse and prose, and a year after graduation his literary career may be said to have begun. It continued uninterrupted for nearly 40 years, save for a twelvemonth spent in prison for participation in the Polish Revolution of 1863. On his release he published, under the pseudonym of Elpidon, his first novel, *The Awakening* (1863). This, like most of his

novels and comedies, satirized the manners and customs of the time in Poland. It was followed by three frank comedies in similar vein: *The Young and the Old* (1866), *The Counselor's Advisers* (1887), and *Hunting a Husband* (1869). Then came a number of novels, among which were *Dazzling Poverty* (1870), *The Jewess* (1871), *Sabina* (1871), *From Camp to Camp* (1872), *The Parson's Niece* (1872), and *The White Negro* (1875). A *Romance without Love* (1870) is one of his most popular novels. Among his other comedies the best known are *The Emancipated* (1873), *Gilded Youth* (1876), *The Amateur Theatre* (1879), *The Town Council* (1880), *The Open House* (1883), *Miss Valerie* (1891), *The Flirt* (1893), and *The Burgomaster of Pipidowka* (1894). Besides these and other of his longer works, Balucki wrote numerous short stories and essays on literary, historical, and dramatic subjects. The distinguishing characteristics of his creative writing are a strong democratic tendency and a persistent scorn of the prejudices and other shortcomings of society. Yet the author's brilliant style and unforced humor have not only saved him from offending his readers, but have actually aided in conveying the much-needed lessons. In this way his influence on Polish readers has been very great, as great perhaps as Gogol's in Russia and Dickens's in England. Owing to his distinctly national appeal, his works have not yet been translated into either French or English, although two or more have been rendered in German.

BALUGA, bā-lūg'-gā. Name applied to the Negrito mixed-bloods of Central Luzon, Philippine Islands.

BAL/USTER, popularly **BAN/ISTER** or **BAL/LASTER** (Fr. *balustre*, It. *balaustrò*, through Lat. *balaustrum*, from Gk. βαλαύστιον, *balaustrion*, flower of wild pomegranate tree; so named from its shape). The name given to small shafts or pillars set in a line at short equal distances, and supporting a capstone or hand-rail. Though balusters were represented in Assyrian bas-reliefs, they seem to have been entirely unknown in classic architecture. Their artistic development came with the Renaissance. The earliest type resembled miniature pillars; then came a type consisting of two short candelabrum-shafts or slender vase-like forms, connected by a scotia and moldings, the lower "vase" being inverted; and finally (c.1540) the baluster with a single vase or pear-shaped swelling with well-defined base and cap. Modern balusters of wood for interior use are often slender spindles, sometimes (since 1750) spirally twisted. Metal balusters of very varied forms are often used. See **BALUSTRADE**; **RENAISSANCE ART**, *Architecture*.

BALUSTRADE, (from *baluster*). A range of balusters, together with the hand rail or capstone which they support; also any decorative railing or parapet, whether designed with balusters or not. It may serve as a parapet for a stairway, balcony, terrace, bridge, or roof, or as a railing for an altar or chancel, or a partition between the public and private parts of any room, as a court room or office. Unimportant as a feature in classic architecture, it was treated with considerable elegance of openwork tracery by the later mediæval architects. It was the Renaissance artists who invented the forms of vase-like balusters commonly used in neo-classic architecture. Among notable examples of Renaissance balustrades may be mentioned those of the Gondi

Palace court at Florence, of the cathedral pulpit at Siena, of the *tribuna* in the Sistine Chapel, of the two *cantorie* or music balconies formerly in the Duomo at Florence (now in the "Opera del Duomo"), sculptured respectively by Luca della Robbia and Donatello, and of the staircase tower of Francis I at Blois, France.

BALUZE, bā'lūz', ETIENNE (1630-1718). A French historian, born at Tulle. Almost his entire life was spent in Paris, and there he published his famous histories, *Histoire généalogique de la Maison d'Auvergne* (2 vols., 1708), and *Vitæ Paparum Avenionensium* (2 vols., 1693). The latter is on the *Index* because of its Gallicanism, and the former led to his temporary banishment because too favorable to Cardinal de Bouillon. He edited the works of Charlemagne and Servatus Lupus.

BALZAC, bāl'zāk', HONORÉ DE (1799-1850). The greatest novelist of France, and, according to some critics, of the world, if we regard at once the quantity of his work, the multitude and variety of his creations of character, his coördination of them into a microcosmic picture of the society of his time, and the scope and depth of his insight into the gaudy ambitions and ideal impulses that actuate human life. His own career had given him a varied and acute experience. He was born at Tours, May 16, 1799, the first of four children of well-to-do *bourgeois*, self-indulgent, a little Rabelaisian, and not at all literary. His infancy was passed with a foster mother in the country. He showed no cleverness in his studies and found no appreciation at home, but he was a diligent pupil of the "truant school." His wanderings along the vineyards of the Loire and in the noisy cooper shops of the suburbs of Tours have left picturesque traces throughout his work, especially in the *Contes drôlatiques*, and he has borne an eloquent witness to the pathos of his school life in *Louis Lambert*.

Balzac had very early what his sympathetic sister Laure calls "the intuition of renown." A family misfortune was to him a kind providence, for it brought him at 19 to Paris and stimulated his literary activity by contact with Guizot, Villemain, and Cousin. His novels, especially *César Birotteau*, attest his three years' study of law; but he refused to practice, and in spite of discouragements, domestic and public, he devoted himself to literature, doubting sometimes his power, but never his vocation. It took him 10 years (1819-29) to learn his trade, the management of his novelistic tools. His work in this period ranks with that of Pigault-Lebrun. Only in the light of the future can it be said to show even promise of the kind of excellence which he was to realize. Harassed by poverty, oppressed by debts due to caprice and bad judgment, he worked indefatigably, and at last produced in *Les Chouans* (1829) a story of Brittany in 1799, one of the first and best of the historical novels of France, though its attempted imitation of Scott is more obvious than successful. What follows *Les Chouans*, good and bad, was admitted by Balzac to a place in his works; what went before, he ignored. The next six years were years of marvelous fertility, sustained excellence, and progressing power, fostered by intercourse with Hugo, Vigny, Lamartine, and George Sand. He made useful aristocratic acquaintances also, the Duchesse d'Angoulême and Madame de Castries, his Duchesse de Langeais. Then he fell under the spell

of a Polish lady, Madame Evelina Hanska, whom he had met some years before, and till the death of M. Hanska, in 1842, his production and development suffer some check, to revive again for the complete flowering of his genius for five years (1842-47). After that he became more and more absorbed in plans for marriage with Madame Hanska, and hindered from work by illness and by visits to the Russian estates of his betrothed, whom he married there a few months before his death. Balzac's correspondence with his sister and his recently published letters to Madame Hanska are a sufficient revelation of his character. To an intense imagination that made him at times a visionary, he joined an intense application that made him at other times a recluse. In thought the child was a man; in action the man was a child, capricious and prodigal, full of schemes that made others rich and kept him poor; restless, passionate, morbid sometimes, especially in the hope deferred of his unfortunate relation to Madame Hanska, but never forfeiting sympathy, because always frank and almost childlike in his broad humanity. There was something awesome in the intensity with which he lived out his 50 years. Hugo expressed this when he said at his grave in Père Lachaise that "such coffins proclaim immortality. We feel the divine destiny of that intellect which has traversed earth to suffer and be purified. So great a genius in his life can but be a great spirit hereafter."

In any survey of Balzac's work it is well to consider first what he tried to do. He explains this in the preface to his novels collected under the title *La comédie humaine*. He says his thought was to do for human nature what had recently been done for zoology—to show that all society was bound together by a unity of composition, diversified by evolution in varied environments, so that there were species of men as of animals. The soldier, the lawyer, the workman, the scholar, the statesman, would show as distinct and abiding characteristics as the wolf, the shark, the ass, the raven, and the sheep. But this, he continues, would require several thousand characters; and how should he give unity to his creations? He would let society tell its own story. He would be its secretary, draw up an inventory of its virtues and vices, gather the facts of its passions, compose types for it by uniting homogeneous natures, and so produce a history of manners from the point of view of a conservative, a Christian, and a monarchist, who knew through friends the Old Régime and the Republic, and had lived under the Empire, the Bourbons, and the democratic monarchy of July. His novels were to be as a secretary's minutes, ideal in conception, but real in detail, shrinking from neither vice nor passion, because these are the motive forces that melt and recast human nature, but giving to religion its due place, and making virtue not only lovable but interesting. That is what he undertook to do, and though his work is incomplete, he left no part un essayed. His achievement stimulated Zola to write his pseudo-realistic novels of the Second Empire; while with scarcely less genius, English society has been drawn in the numerous books of Anthony Trollope, as many phases of nineteenth-century America are presented by William Dean Howells. Balzac has a right to ask that his work be judged as a whole, by the good as well as by the evil. Like that other *Comedy* of Dante, his *Human Comedy* has its Hell, but it has also its Purga-

tory and its Paradise. Balzac is by some considered immoral; others pronounce his work, as a whole, serious in purpose, high and edifying in tone.

The *Comédie humaine*, as it stands, vast yet unfinished, has been compared by Zola to a cyclopean palace, with splendid halls and wretched corners, with broad corridors and narrow passages, and superpiled stories in varied architecture. Two thousand characters cross its stage; and in their mimic life, which to Balzac for the time became reality, they formulate the chief types and events of social existence in such a variety of setting that his comedy has not only its genealogy but its geography. It is a work of criticism, analysis, and investigation, to be enjoyed in its parts, but to be understood only as a whole. Balzac divided his *Human Comedy* into *Scenes of Private Life*, of *Provincial Life*, of *Parisian Life*, of *Country Life*, of *Politics and War*, and to these he added *Studies*, philosophical and analytic. There are those who admire the analytic acumen displayed in this division; but as Balzac frequently transferred tales and novels from one to another group to suit his fancy or a publisher's convenience, it seems time wasted to stress the classification. It is more philosophical to study his work as it grew in his mind—i.e., chronologically—and then to treat it briefly in its entirety. *Les Chouans* was followed by six *Scènes de la vie privée* (1803), of which *El Verdugo* is a masterly tale of terror, and *Gobseck* one of the world's great studies of morbid avarice. *La maison du chat-qui-pêlote* (1830), written before these, though published a little later, in its plea for conventional marriage shows Balzac to be a master in social psychology. And, as though he would excel at once in every genre, the same year witnesses the Dresden-shepherdess introduction and the luridly romantic close of *Une double famille*; the curious Machiavellianism of *Les deux rêves*; *Adieu*, a masterpiece of tragic pathos; the fantastic *L'élisir de longue vie*; two stories of abnormal love, *Sarrasine* and *Une passion dans le désert*; and, finally, an acute study of the purification of religious feeling through persecution in *Une episode sous la terreur*. And with all this came contributions to journals whose titles for this year alone fill two octavo pages of Louvenjoul's *Histoire des œuvres de Honoré de Balzac*.

A marvelous fertility characterized the next three years, till his first meeting with Madame Hanska (1833). Much of this time he passed away from Paris, to avoid interruptions. The more important works of 1831 are *La femme de trente ans* (incomplete), *L'enfant maudit* (incomplete), *Le réquisitionnaire*, *Les exilés* (a wonderful evocation of Paris in 1308, setting ajar the gate that was to open on the spirit world in *Louis Lambert* and *Séraphita*); *Le chef d'œuvre inconnu*; the remarkable *L'Auberge rouge*; the curiously mystic *Peau de chagrin*; the mediæval legend, *Jésus-Christ en Flandre*; a remarkable study of avarice, *Maitre Cornélius*; and, outside the frame of the *Human Comedy*, the *Contes drôlatiques* (the first of three *dizaines* published till 1837). The work of 1832 is even more remarkable. It touches the depths of horror in *La grande Bretèche*, deals gracefully with romantic honor in *Madame Firmiani*, and with romantic love in *La bourse*; becomes pitiful in *Colonel Chabert*, and tragic in *Le message*; gives an exquisite picture of child life in *La grenadière*,

preaches a stern social morality in *La femme abandonnée*, epitomizes the French clergy of the Restoration in *le curé de Tours*, unveils the courtesan morals of the Renaissance in *Les Marana*, and crowns the year with the mystic *Louis Lambert*. And during 1833, also, he tells a correspondent that he lives in "an atmosphere of thoughts, ideas, plans, works, conceptions, that mingle, bubble, and sparkle in my brain." Of these, the *Contes drôlatiques* show the effervescing of a joyous animal nature; *Féragus* is a sort of detective story; *Le médecin-de-campagne* is photographic in its reproduction of peasant thought and country scenes, and *Eugénie Grandet* is Balzac's greatest study of avarice, and perhaps his greatest novel. No wonder that in January, 1834, Balzac complains that he is "dazed with ideas and hungry for rest." Yet this year produced *Père Goriot*, thought by many to be his best novel; *La duchesse de Langeais*. *Le recherche de l'absolu*, part of *Séraphita*, and many revisions of older work. Balzac now begins to suffer, naturally, from neuralgia, but in 1835 writes a fine study of remorse, *Une drame au bord de la mer*; an inferior one, *Mcmoth réconcilié*; the weirdly sensuous *La fille aux yeux d'or*; and that subtly humorous "bride's breviary," *Le contrat de mariage*. His one long novel of the year, *Séraphita*, is regarded by many as an exquisitely mystic poem in prose, a hymn to the purification of human passion by a sublime aspiration for the divorce of sentiment from sense, first product of that love of his for Madame Hanska which almost immediately became a distraction and a hindrance to his genius. Students of Balzac are, however, not in accord as to the merits of *Séraphita*, which has been described as an obscure reflection of Swedenborgianism, and full of passages that are meaningless.

With 1836, we enter on a period of arrested development, although that year offers the charming *Messe d'Athée*; the ultra romantic *Lys dans la vallée*; the admirable last part of *L'enfant maudit*; a classic study of *La vieille fille*, the French *School for Scandal*; *L'interdiction*, a legal romance, and some less significant work. *Les employés* marks in 1837 the lowest ebb of the mature Balzac. *Gambarra*, *César Birotteau*, and the *Contes drôlatiques* complete the work of that year; and 1838 is as relatively insignificant, with *Le cabinet des antiques*, *La maison Nucingen*, *Une fille d'Eve*, and the first part of what was to become a great novel, *Les splendeurs et misères des courtisanes*. In this year he bought a country house, "Les Jardies," where Gambetta was to meet his death, and where Balzac did most of his work until, in 1843, he bought and fitted up, in long-deferred hope of marriage, the city house in which he died. His country life lent a passing freshness to *Le curé de village* (1839) and to the early parts of *Béatrix*, a curious study of the instinct of social conformity common to all phases of feminine affection—the platonic, the cerebral, and the venal. To 1839 belongs also *Massimilla Doni*, and 1840 brought *Le secret de la Princesse de Cadignan*, the fine *Seconde étude de femme*, *Pierrette*, *La muse du département*, part of *Les illusions perdues*, with some very inferior work. Then something of his old exuberance returns, and 1841 sees *Une ténébreuse affaire*, the terrible *Bachelor Housekeeping* (*La rabouilleuse*), *Ursule Mirouet*, *Les mémoires de deux jeunes mariées*, *La fausse maîtresse*, and *Le martyr*

calviniste. The year 1842 is unimportant in production, but memorable for the first collected publication of the *Human Comedy* under that title, with its evolutionist preface, and for additions and revisions to which this gave occasion. In 1843, Balzac spins copy in *Honorine*, finishes *La muse du département* and *Les illusions perdues*, a satire on French journalism, his longest novel, and by the number of its characters and the ramifications of its plot, one of the chief radiating points in the study of the psychology of *La comédie humaine*. He visited Madame Hanska, now a widow, this year in Russia, and in 1845 and 1846 twice in Italy and once in Germany; but he now worked, as he says, "with a fury more than French—Balzacian." In 1844 he printed the playfully romantic *Modeste Mignon*, completed *Beatrix* and *Les petits bourgeois* (printed, 1854), and published all that appeared during his lifetime of *Les paysans*, the most sternly realistic of his novels. The years 1845 and 1846 produced only trivial work; but he was working on four great novels that were to crown his genius, *La cousine Bette*, *Cousin Pons*, *Les splendeurs et misères des courtisanes*, and *L'envers de l'histoire contemporaine*, that was to close the *Human Comedy* with its noblest conception of Christian womanhood. Sickness made his last years unfruitful; and his posthumous *Député d'Arcis* is largely by his literary executor, Charles Ribou. Balzac's attempts in drama, except possibly *Mercadet* (first acted in 1851), are not significant.

Balzac died in Paris, Aug. 18, 1850, at the height of his fame; but he was hardly appreciated at his true value until the epoch-making study by Taine (1865) showed him to be truly classic, one of the world's greatest creators in imaginative literature. The dominant trait in his style, imagination, and thought is exuberant virility. He has the animal and the intellectual intemperance of a romantic realist. He observes with minute accuracy, but with a poet's vision. He is of his world, yet he dominates it. No depths, no heights, of human nature seem foreign to him. His qualities become his defects. He is embarrassed at once by his wealth of ideas and of words. At his best his style is admirable, but it often staggers and occasionally falls under over-elaboration. In construction the stories lack proportion, but in character-drawing he stands next to Shakespeare. Here are the money-grubbers and the money-spenders, studied realistically and in symbolic types; cynics who mock the pleasures they pursue; parasites of social disease; fresh young girls; restless "women of thirty"; poor relatives; philanthropists; saints—a social microcosm. Here is a novelist who tried to see life steadily, to correlate all the material, moral, and social factors of modern society. With Shakespeare and Saint-Simon, says Taine, Balzac is "the greatest storehouse of documents that we have on human nature."

Balzac's works: 24 vols. fiction separately; *Human Comedy*, 47 vols.; *Droll Stories*, 3 vols.; *Drama*, 2 vols.; *Correspondence*, 2 vols.; *Letters to Madame Hanska*, 1 vol. The youthful *Works* are published in 10 vols. In 1913 there began to appear from the Imprimerie Nationale in Paris, the definitive edition of *The Comédie Humaine*, planned to consist of 43 volumes, with 1500 illustrations by Paul Huard. Three volumes contain bibliographical notes and other comments, a life of Balzac, and a critical estimate of his place in literature, while each vol-

ume is to contain a key to the identity of the persons whom Balzac had in mind in creating his characters that are famous in the particular volume. The researches of the Vicomte de Louvenjoul are to be utilized, so as to make accessible all that is now known or probably will ever be known concerning this great master of fiction.

Bibliography. The more essential books for a study of Balzac are Louvenjoul, *Histoire des œuvres de Honoré de Balzac* (Paris, 1886); M. F. Sandars, *Honoré de Balzac: His Life and Writings* (New York, 1905); Corbeier and Christophe, *Répertoire de la comédie humaine* (Paris, 1887), a dictionary of characters. For plots consult Barrière, *L'œuvre de Balzac* (Paris, 1890); for criticism, Louvenjoul, *La genèse d'un roman de Balzac; Les paysans* (Paris, 1901); the essays of Taine, Sainte-Beuve, Faguet, Zola, Paul Flat, Doumic, Duclaux (1909), Peck, and Wells, *A Century of French Fiction* (1898); for biography: Wormley, *Memoir of Balzac* (Boston, 1892; defective); Ferry, *Balzac et ses amis* (Paris, 1888); Lemer, *Balzac, sa vie et ses œuvres* (Paris, 1892); Hanotiaux and Vicaire, *La jeunesse de Balzac* (Paris, 1903); A. Le Breton, *Balzac, l'homme et l'œuvre* (Paris, 1905); Ferdinand Brunetière, *Balzac* (Paris, 1906; trans. Philadelphia, 1906), with a bibliographical appendix; Frederick Lawton, *Balzac* (London and New York, 1910). Translations, fairly complete and satisfactory, of the *Human Comedy* are published in London, Boston, Philadelphia, and New York, the last-named containing valuable editorial and critical comment by W. P. Trent. The latest translation of the works of Balzac is the *Centenary Edition*, K. P. Wormley, translator (Boston, 1903-1912). Saltus, *Balzac* (Boston, 1888) has a good bibliography. The most indefatigable collector of Balzaciana has been the Vicomte Spoetboereh de Louvenjoul (q.v.), whose remarkable industry and lavish expenditure have lately given the world access to original documents that have thrown much new light on the life and thought of the great novelist.

BALZAC, JEAN LOUIS GUEZ DE (1597-1654). A noted French essayist and stylist. He was born at Angoulême of wealthy parents, and having received a good education was taken by Cardinal de la Valette to Rome, and wrote thence letters to persons prominent at court that made him recognized on his return as master of composition and style in a generation that regarded such abilities with excessive reverence. His letters, collected in 1624, are empty, bombastic, and affected, but they entitle Balzac to rank as a reformer of prose, as his contemporary, Malherbe (q.v.), is of verse. He underwent bitter accusations of plagiarism in 1625 and withdrew to Angoulême, where he produced his uninspired and laborious lucubration, *Le prince* (1631); *Discours* (1644); *Le barbon* (1648); *Aristippe*. He was elected to the Academy in 1634. Balzac's *Works* were collected in 2 vols. (Paris, 1665, 1854). The *Letters* are well edited by Larroque (Paris, 1874).

BALZANI, bál-tsá'ná, COUNT UGO (1847-). An Italian historian, born in Rome and educated at the university of his native city. He became known as a distinguished scholar in his chosen field, and honors were heaped upon him at home and abroad. He was made a member of the Reale Accademia dei Lincei and of the Istituto Storico Italiano, and was chosen presi-

dent of the Reale Società romana di storia patria. In England the University of Oxford conferred upon him the honorary degree of Litt.D., and the British Academy elected him a corresponding fellow. To the transactions of various continental institutions with which he became connected he contributed many articles and reports, and wrote also: *Il Regesto di farfa di Gregorio di Catino* (1879); *La Storia di Roma nella Cronica di Adamo da Usk* (1880); *Early Chroniclers of Italy* (1883); *Le Cronache Italiane nel Medio Evo* (1884; 1909); *The Popes and the Hohenstaufen* (1886).

BALZICO, bál-tsé'kó, ALFONSO (1825-1901). An Italian sculptor. He was born at Cava di Tirreni, near Salerno, and studied his art principally at Rome. On his return to Naples he secured the patronage of the Bourbon monarch, but his patriotic tendencies resulted in his call to Turin by Victor Emmanuel I. Among his commissions for the latter the principal were the bronze equestrian statue of Duke Ferdinand of Genoa (1867, Turin, his masterpiece), and Massimo d'Azeglio (1873, Turin). He removed with the royal family to the new capital, Rome, where his later life was spent. His other works include the marble monument to the composer Vincenzo Bellini, and the bronze "Victor Emmanuel" (1897), both in Naples; and "Cleopatra," a nude which obtained the gold medal at Paris, 1900. Balzico's art forms a marked exception to the dreary mediocrity of the Italian sculpture of his day.

BAMAKO, bá'má-kó'. A town of Africa and, since 1904, the capital of the French colony of Upper Senegal and Niger. It is situated about 135 miles southwest of Segou, in lat. 12° 15' N., and long. 8° 5' W. (Map: Africa, D 3.). The town is the terminus of the Niger-Senegal Railway and is an important trade centre. Pop., 1911, 6539.

BAMBA, bām'bá. A Bantu tribe of the Ba-Fyot, or Ba-Kongo group, Angola. They are of medium stature, the figure well rounded and well proportioned, with woolly hair, dark-brown color, beardless, and little hair on the body. They have adopted some of the arts of Europeans, though they easily revert under tribal influences. They are polygamists and ancestor worshipers, and practice witchcraft, although images of Roman Catholic saints are employed as fetiches. Small terra-cotta images are placed on the graves of important men.

BAMBARA, bām-bā'rá. A region in west Africa, situated on both sides of the upper Niger. It derives its name from the inhabitants, who were formerly under kings; but upon the overthrow of King Ahmadu in 1891 the country was divided into several states under Bambar chiefs. It is mountainous in the southwest and flat and often swampy in its northern part. It has a soil of remarkable fertility, yielding annually two crops of corn, rice, yams, and many kinds of fruit. Forests of butter trees cover vast tracts. The climate is very hot, and the lower parts of the country are subject to inundation from time to time by the Niger. The principal industries are the weaving of cloth, a work performed exclusively by women, and the manufacture of metal and leather products. The commerce is quite extensive. The principal towns are Segou, Sansanding, and Bamako. The region is a part of the French West African colony of Upper Senegal and Niger. The inhabitants are heathens of mixed negro and Fulah blood and belong to the Mandingo family. They are a mild and indus-

trious people; but, despite their fertile soil and their thrifty habits, they have been reduced to the direst poverty by their Mohammedan oppressors, the Toucouleurs. Their country was visited by Mungo Park.

BAMBERG, bām'bérk. A city in the district of upper Franconia, Bavaria, beautifully situated on the banks of the Regnitz, not far from its confluence with the Main, about 30 miles north of Nuremberg (Map: Germany, D 4). Numerous bridges connect the various sections of the city, which is intersected by three branches of the river. The streets are wide and well built, and there are a number of attractive squares. The most noteworthy of its public buildings is the cathedral, a magnificent edifice in the Byzantine style, founded by Henry II early in the eleventh century and restored after a fire in 1110. It contains, among other monuments, the elaborately carved tomb of the founder and his consort, Cunigunda. Attached to the cathedral is a library of over 300,000 volumes, with valuable missals and manuscripts and what is represented to be the prayer book of Henry II. There are several other fine ecclesiastical structures of early date and the old palace of the former prince-bishops of Bamberg. The ruins of the castle of Altenburg, originally the seat of the Count of Babenberg and the scene of many important historical events, stand on an eminence about a mile and a half from the town. The educational institutions of Bamberg are numerous, as are also the charitable institutions, which include a municipal hospital, an orphan and an insane asylum. The industries consist chiefly of the manufacture of beer—which is famous throughout Germany—cotton, woollens, gloves, furniture, musical instruments, shoes and leather goods, tobacco, sugar, starch, etc. The United States is represented by a consular agent. The city's government is in the hands of a municipal council of 42 members and an executive board of 19, elected by the former. Bamberg received municipal privileges in 973. Pop., 1900, 41,820; 1910, 48,063. Consult Vöge, "Ueber die Bamberger Domsculpturen," in *Repertorium für Kunstwissenschaft*, vol. xxii (Berlin, 1899).

BAMBERGER, bām'bérk-ér, LUDWIG (1823-99). A German parliamentarian and writer on political and economic subjects. He was born at Mainz, of Jewish parentage, and studied law at Giessen, Heidelberg, and Göttingen. Implicated in the Revolution of 1849 as editor of the *Mainzer Zeitung*, he was condemned to death, but was amnestied in 1866. As a member of the National Liberal Party in the Reichstag (1871-80) he defended the gold standard against the bimetalists, opposed the economic policy of Prince Bismarck (after 1879), and advocated free trade, becoming the founder and president of the Verein zur Förderung der Handelsfreiheit. Compelled by his antagonism to Prince Bismarck's theories to resign from the National Liberal Party, he formed the group known as the "Secessionists," which afterward became merged in the German Liberal Party, and as a member of which he opposed the colonial policy of the government. The following are some of his important publications: *Erlebnisse aus der pfälzischen Erhebung* (1849); *Monsieur de Bismarck* (1868; English translation, 1869); *Die fünf Milliarden* (1873); *Deutschland und der Sozialismus* (1878); *Deutschthum und Judenthum* (1880); *Die Stichworte der Silberleute besprochen* (4th ed., 1893); *Erinnerungen* (published by Nathan, 1899).

BAMBINO

BAMBINO

FROM THE SCULPTURE BY ANDREA DELLA ROBBIAS IN THE FOUNDLINGS' HOSPITAL, FLORENCE

feet and is the only known pass over the Hindu-Kush, 40 miles north of the ruins of Bamian, for artillery and military transport. This is believed to have been the route followed by Alexander the Great in his conquests in western Asia. Considerable interest attaches to this region on account of the historical remains in the form of numerous cells hewn in the rock, and the gigantic statues which seem to indicate that the place was once one of the chief centres of Buddhist worship. The two largest statues are found in a deep niche and in spite of their dilapidated condition still show some traces of elaborate carving and painting. Each contains a winding stair, by which it is possible to ascend to the head. The whole valley is covered with the ruins of tombs, mosques, and other buildings, once belonging to the town of Ghulghuleh, which more recently occupied this site and was destroyed by Genghis Khan in 1221. Eight miles eastward of Bamian lies the ancient fortress of Zohak, attributed to the fabulous Persian serpent-king of that name. The fortress is preserved for the purpose of guarding the important pass. Both there and in the valley of Bamian a great number of coins, ornaments, and other antiquities have been found.

BAMPTON LECTURES. These lectures are so called after the name of their founder, the Rev. John Bampton, Canon of Salisbury (died 1751), who left estates, originally worth £120 per annum, to the University of Oxford, for the endowment of eight divinity-lecture sermons, to be preached at Great St. Mary's every year and to be published at the expense of the estate within two months of their being preached. The preacher is to lecture on one of the following subjects: "The Confirmation of the Christian Faith and the Confutation of all Heretics and Schismatics," "The Divine Authority of the Scriptures," "The Authority of the Primitive Fathers in Matters of Christian Faith and Practice," "The Divinity of Christ," "The Divinity of the Holy Ghost," "The Apostles' and Nicene Creeds." No person is qualified to preach these lectures who has not taken the degree of M.A., either at Oxford or Cambridge, and the same person shall never preach them twice. The first course was delivered in 1780, and they are still continued (since 1895, biennially). The more noteworthy of these lectures are those by White, in 1784, *Christianity and Mohammedanism*; Nott, in 1802, *Religious Enthusiasm* (against Whitefield and Wesley); Mansel, in 1858, *The Limits of Religious Thought*; Liddon, in 1866, *Our Lord's Divinity*; Hatch, in 1880, *The Organization of the Christian Churches*; Farrar, in 1885, *History of Interpretation*; Cheyne, in 1889, *The Psalter*; Gore, in 1891, *The Incarnation*; Sanday, in 1893, *Inspiration*; Inge, in 1899, *Christian Mysticism*. The complete and official list of lectures will be found in the *Historical Register of the University of Oxford* (published yearly).

BAN (OHG. *ban*, *bann*, AS. *bann*, order under threat of punishment; hence Fr. *ban*, public proclamation). A word derived from a root signifying 'to signal,' 'to proclaim,' which meaning it retained in the phrase *bans* or *banns* (q.v.) of marriage. In feudal times it denoted a summons to arms and also the military force thus summoned. The latter meaning it retains in several countries of Europe—as in France, where the National Guard is classed as the *ban* and the *arrière-ban*, or reserve; and in Ger-

many, where the two divisions of the *Landwehr* are distinguished as the first and second *bans*, respectively. In the Middle Ages the *Acht* or *bannum* was a sentence of outlawry pronounced against those who escaped from justice or refused to submit to trial. We often read of refractory princes, and even cities in Germany, being placed under the *ban of the Empire*. The following are the terms of banning used in an old formula: "We declare thy wife a widow and thy children orphans; we restore all thy feudal tenures to the lord of the manor; thy private property we give to thy children, and we devote thy body and flesh to the beasts of the forest and fowls of the air. In all ways and in every place where others find peace and safety, thou shalt find none; and we banish thee into the four roads of the world—in the devil's name." Besides these sentences of outlawry, many other announcements were accompanied with denunciations and imprecations. When a grant of land was made for a religious purpose, or when a charter of liberties was granted, the transaction was proclaimed in public with certain ceremonies, and curses were denounced against any one who should violate the deed. Thus *banning*, or publishing, came to be associated with cursing; and hence the origin of the popular use of the word. It occurs in this sense in Shakespeare, Milton, and other early writers. The phrase "ban of the Church" is the equivalent of the term "excommunication" (q.v.).

BAN, or **BA'NUS** (*ban*, in Southern Slavic and Hungarian, from Persian *bān*, lord; cf. Russ. and Pol. *pan*, master, lord). The title given to some of the military chiefs who guarded the southern boundaries of the Hungarian Kingdom. It is equivalent to the German *markgraf* and the English "Lord of the Marches." The ban was appointed by the King, and his appointment was ratified by the Diet. In political, judicial, and military affairs his powers were almost royal, especially within his own territory. In times of war he led the troops of his *banat* (q.v.). Among the *banats* were those of Dalmatia, Croatia, Slavonia, and Bosnia. Their boundaries were constantly changing with the encroachments of the Turks. In the sixteenth century there was formed the double *banat* of Dalmatia and Croatia. In the reign of Maria Theresa the ban was acknowledged to be the third dignitary of the Kingdom of Hungary; appointed a member of the Hungarian Council of Government, and President of the Council of the Banat; and was made the bearer of the Golden Apple (the symbol of sovereignty) at the coronation of the King. In 1849 Croatia, Slavonia, and Dalmatia became Austrian crownlands; but by the *Ausgleich* of 1867 Croatia and Slavonia were restored to Hungary and continued as a *banat*, with a special local administration for internal affairs.

BAN, *bān*, **MATIJA** (1818–1903). A prominent poet of the southern Slavs. He was born at Dubrovnik (Ragusa), where he received a good education, including a thorough knowledge of French and Italian. He traveled extensively over the Balkan Peninsula, made his literary debut with Italian lyrics (*Il terremonto di Ragusa*; *Il Moscovito*; *Radimiro*), and settled in Belgrade (1844) as tutor to the daughters of Prince Alexander Karageorgevitch. It was for their benefit that he wrote *The Woman's Educator* (3 vols., Belgrade, 1847). From 1849 till 1853 he published the literary-scientific maga-

zine *Dubrovnik* at the city of the same name. Besides a drama, *Mejrima*, he published in his native tongue *Various Songs* (1853), mostly on erotic and political themes, and the following year was appointed instructor in French and Italian at the Belgrade Lyceum. The adverse criticism evoked by his ode addressed to the Sultan forced him to resign this post and devote the rest of his life to literary labors and travel. Among his tragedies the most noteworthy are *Dobriilo and Milenka*; *Tsar Lazar*; *The Death of Prince Dobroslav*; *Jan Hus* (1884); *Martha the Statholder*; or, *The Fall of Novgorod the Great* (1881).

BANA, blā'nā. A thousand-armed deity in Hindu mythology. His arms were cut off by Krishna, but his life was spared by the interposition of Siva, who was his friend.

BANA (seventh century A.D.). A Sanskrit author. His greatest works were two novels, the *Harshacarita*, or *Adventures of Harsha*, a historical romance (Eng. trans. by Cowell and Thomas, London, 1897), and the *Kādambari* (Eng. trans. by C. M. Ridding, London, 1896). Both of Bana's stories are largely indebted to the *Vāsavadattā* of Subandhu. He also wrote the *Parvatiparinayanatakam*, or 'Parvati's Marriage,' based on the *Kumārasambhava* of Kalidasa and a farce, the *Sarvacarita*. A lost drama by him entitled *Mukutadātaka* is mentioned, and some have ascribed to him the Buddhist play *Nagānanda*, or 'Joy of Serpents,' usually attributed to Harsha or to Dhavaka. Bana's lyrics are contained in his *Caṇḍāstaka*, or 'Century of Durga.'

BANAK, bān'ak, or **BANNOCK** (native name *pan-iti*). A warlike tribe of Shoshonean stock, formerly roving over southern Idaho and eastern Oregon, and now concentrated upon the Fort Hall reservation, Idaho. They are confederated with the Shoshone, the two tribes together numbering about 1400 persons, "so intermarried and related to each other that it is nearly impossible to distinguish one from the other." Consult R. H. Lowie, "The Northern Shoshone," *Anthropological Papers, American Museum of Natural History*, vol. ii (1909).

BANANA, bā-nā'nā. The only seaport of the Belgian Congo and situated on a small sandy peninsula on the west coast of Africa, at the mouth of the Congo (Map: Belgian Congo, B 4). The town is a trading station, contains a number of foreign factories, and has a white population of about 120. The port is connected by steamship lines with Hamburg, Liverpool, and Antwerp.

BANANĀ, bā-nā'nā (Sp. the fruit of the tree *banano*). A name applied alike to the well-known fruit and to the plant which bears it. Most of the varieties commonly eaten raw belong to the species *Musa sapientium*, which name signifies 'muse of the wise,' and is intended to convey an allusion to a statement by Theophrastus concerning a fruit which served as food for the wise men of India, and which, from his description, is supposed to have been the plantain or banana. The names "plantain" and "banana" are somewhat vaguely used in their application to different cultivated varieties, but the true plantains or cooking bananas belong to *Musa paradisiaca*. The banana is a tropical plant grown for its fruit, fibre, and the beauty of its foliage. It is evidently of Indian origin, but is now extensively cultivated in all tropical countries of the world. It is a large herbaceous

plant with a perennial root or rhizome, from which the plant is perpetuated by sprouts or suckers. The young plants may be transplanted, after attaining a height of 3 feet, by cutting them loose with a spade; such plants should be set deeply in rows of 8 to 12 feet apart, so that the broad leaves will shade the ground. It can be increased by root cuttings planted shallow and covered with peat or peaty compost. Young plants of this sort must be transplanted to full light and be given ample room as soon as two or three leaves have formed. The banana begins to bloom in 1½ to 2 years after being established. The flower bud is a peculiar, large heart-shaped formation which, on developing, exposes a true flower under each of its scales. From 50 to 150 of these may be developed in a single bud, from which a bunch containing as many bananas will develop. The plant grows from 10 to 40 feet in height and carries a whorl of broad ornamental leaves at the top of the stalk. A stalk bears but once, dies down, and is replaced by sprouts, two or three of which are allowed to bear.

The species grown for their fibre, as well as those grown for ornament, usually produce seed, while the edible banana of commerce is seedless. Those which bear seeds are usually propagated by seeds, as it is more economical. Dwarf sorts are chiefly used for ornamental planting and landscape effect, but the Chinese Dwarf or Cavendish banana, *Musa cavendishii*, is an important shipping banana in Hawaii. Recently this variety has been somewhat extensively planted in Central America because it is more resistant to disease than the varieties commonly grown there.

There are many varieties of the banana, but the variety most commonly grown is the Martinique, a large yellow fruit growing in large dense clusters. The *baraçoa*, or Red Jamaica, is now but sparingly grown as compared with a few years ago and is seldom exported. The banana is a very important fruit, wholesome, palatable, reasonable in price, and in market the year round. It is eaten raw and cooked. For the latter purpose the under-ripe fruit in which starch has not yet been converted very largely into sugar, is preferable. Bananas have, on the average, the following composition: water 75, starch, sugar, etc. 21, and fat, crude fibre, protein, and ash each 1 per cent. This fruit has a little lower water content than other common fresh fruits and so a little higher food value, pound for pound. Its food value lies in the carbohydrates (sugar, starch, etc.) it supplies, the energy value being 460 calories per pound.

The imports of bananas in the United States alone have increased from a few hundred bunches in 1870, to \$14,484,258 in 1913. The fruit comes chiefly from the West Indies and Central America, although some is produced in Florida, Louisiana, California, and Hawaii. Banana flour, made by grinding the dried unripe fruit, is used quite largely in banana-growing countries, and is becoming known elsewhere. Dried ripe bananas, used like figs or raisins, are also finding a market. See PLANTAIN. For illustration see BREADFRUIT TREE.

Banana Diseases. With the rapid extension of commercial plantings of bananas a number of serious diseases have appeared in Central America, South America, and the West Indies. There is divided opinion regarding the causes of these

BAMBOO, ETC.

1. GIGANTIC BAMBOO, from Ceylon.

2. PAPER BIRCH (*Betula papyrifera*).

3. GREAT BANYAN TREE, in Calcutta Botanical Gardens.

diseases. Some appear due to bacterial attack, while others are attributed to parasitic fungi. One disease, known as the Surinam Panama disease, has practically ruined the plantations in Surinam. According to Drost, it is due to the fungus *Leptospora musæ*. Another trouble, also known as Panama disease, is caused by species of *Fusarium*. There appear to be marked differences in the resistance of different varieties to these diseases. Other fungi reported as seriously attacking banana plants are *Marasmius semustus*, *Sphaerostilbe musarum*, *Thielaviopsis paradoxa*, and *Cercospora*.

BANANA-BIRD. The name of several birds which feed on bananas. In the American tropics any species of oriole (*Icterus*) or a hangnest may be so called, though this is a book name rather than one in common use. (See **ORIOLE**.) In Jamaica and the Antilles the small honeycreepers of the genus *Certhiola* or *Cœreba* are popularly called banana-quits (see **PLATE OF CREEPERS**), and the African plant-cutters—glossy black, cuckoo-like birds of the genus *Musophaga*—are styled banana-caters.

BANANA FAMILY. See **MUSACEÆ**.

BANANA-FISH. See **LADYFISH**.

BANANAL, bi'ná-nál' (also called Santa Anna). An island lying in the Rio Araguaya, province of Goyaz, Brazil (Map: Brazil, G 6). It is over 200 miles long, with a width of 35 miles, has a fertile soil and forests of valuable woods. North of the centre is a lake of considerable size.

BANAS, bá-nás', or **BUNAS**, bū-nás'. A river of Rajputana, near the Aravalli Hills, and joining the Chambal after a northeasterly course of over 300 miles (Map: India, C 3).

BANAT, bân'at, Ger. pron. bá-nüt' (for derivation, see **BAN**). A common name applied to any district or territory under the administration of a ban, but specially applied to a district of southern Hungary comprising the three counties, Temes, Torontál, and Krassó-Szörény (Map: Hungary, G 4), though it was never ruled by a ban. The total area is 11,013 square miles; the total population, which is very heterogeneous, in 1900 was 1,528,605, and at the census of Dec. 31, 1910, 1,582,133. Temes has an area of 2761 square miles, with (1900) 400,910 inhabitants (in addition Temesvár and Versecz, towns with municipal rights, with 33 square miles and 72,555 inhabitants and 76 square miles and 27,370 inhabitants respectively); Torontál, 3823 square miles and 594,343 inhabitants (in addition, Pancsova, town with municipal rights, 44 square miles and 20,808 inhabitants); Krassó-Szörény, 4276 square miles and 466,147 inhabitants. The principal town of the district is Temesvár. The Banat is one of the most fertile and best-cultivated districts of Hungary. Owing to its mild climate and rich soil, abundant crops of grain and fruits are raised, while the mountains contain rich mineral deposits, especially coal. Among its numerous mineral springs, the best known are those of Mehádía, in Krassó-Szörény county. The district, which from 1652 to 1716 was under the Turkish dominion, became uninhabited and covered with forest and marshes, but was reclaimed under Maria Theresa, who drained the land by means of canals and by free grants of land induced a considerable immigration from Germany, Turkey, and Serbia, thereby laying the foundations of its present prosperity. In 1779 it was united with Hungary. It was formed into an Austrian

crownland in 1849, but was restored to Hungary in 1860. See **BAN**.

BAN'BRIDGE. A town in county Down, Ireland, built on a steep slope on the left bank of the Bann, 76 miles north of Dublin (Map: Ireland, E 2). It is a thriving seat of linen manufacture in all its stages, from the preparation of the soil for the flaxseed to the finishing of the finest linen. Miles of bleaching-grounds exist in the vicinity, while there are numerous factories along the Bann. Pop., 1901, 5006; 1911, 5101.

BANBURY, bân'bér-I (anciently Berenburig, Bera's fort). A market town in Oxfordshire, England, on the Cherwell, and the Oxford Canal, 23 miles north of Oxford (Map: England, E 4). Banbury is the centre of the famous rich red land of Oxford County. This region is one of the most fertile in the kingdom. Banbury is noted for its manufacture of agricultural implements and for malt liquors, leather, cheese, and cakes. It was a stronghold of Puritanism in the seventeenth century, and the term "Banbury man" came to be applied, as a term of derision, to the typical Puritan. The old "Banbury Cross," famous in the nursery rhyme, is replaced by a modern one. There are a castle, several fine churches, and the town possesses excellent schools. It was incorporated as early as 1553. Pop., 1891, 12,767; 1901, 12,967; 1911, 13,458. Consult Beesley, *History of Banbury* (London, 1841). See **CROSS**.

BANC (OF. *banc*, Low Lat. *bancus*, MHG. *banc*, Ger. *Bank*, bench). In law, the bench or seat of judgment. Hence the sittings of a superior court of common law, composed of more than one judge, to determine questions of law; or the sittings of a full court or quorum, as distinguished from the sittings at *nisi prius* (q.v.), or by one judge, for the purpose of trying issues of fact, are called "sittings in banc" or "in banco." The term is in use in the United States as well as in England. See **BENCH**; **COMMON BENCH**; **COURT**.

BANCA, bân'ká, or **BANKA**. One of the Dutch East Indian islands northeast of Sumatra, from which it is separated by the Banca Strait. It is of an oblong shape and covers an area of about 4450 square miles (Map: East Indies, C 5). Its surface is generally flat, although it has some elevations on the northern and southern ends. The climate is moist and unhealthy for Europeans. The most important product of the island is tin, which has been mined by the government since 1832. The annual yield of that metal is between 15,000 and 20,000 tons. The surface is heavily wooded and the flora is remarkable. Spices grow widely, as do other tropical products. The principal articles of import are rice and salt. The population of Banca in 1905 was 115,189, of which about 250 are European and over 35,000 Chinese. Administratively Banca, together with a few adjacent small islands, constitutes a separate residency.

BANCA, bân'ká. A small boat, used in the Philippine Islands. It is shaped from a single log and therefore belongs to the class called "dugouts." Practically all of them are fitted with outriggers like the proas. The crosspieces are usually of bamboo, and the float is often of the same material. A few of the boats are of rather large size, are built with frames and planking, and have a schooner rig.

BANCANUS. See **BANKBAN**.

BANCO, bǎp'kô (It. bench, counter, bank). A commercial term meaning the standard money in which a bank keeps its accounts, as distinguished from the current money of the place. The distinction was more necessary when the currency consisted, as it often did, of clipped, worn, and foreign coins. These early banks (at Venice or Amsterdam, for instance) received at their intrinsic worth, crediting the depositor in their books with this bank value. The term was chiefly applied to the money in which the Hamburg bank kept its accounts, before the adoption of the new universal coinage of the German Empire. It was not represented by any coinage.

BANCROFT, bǎn'krôft or bǎn'krôft, CECIL FRANKLIN PATCH (1839-1901). An American educator, born at New Ipswich, N. H. He graduated in 1860 from Dartmouth College, studied in German universities, and in 1867 having finished his course at Andover Theological Seminary, was ordained to the Congregationalist ministry. From 1860 to 1864 he was principal of the Appleton Academy at Mount Vernon, N. H., and from 1867 to 1872 of the Lookout Mountain Educational Institutions, Tennessee. In 1873 he was appointed principal of Phillips Academy, Andover, Mass. It is said that he prepared more students for colleges and scientific schools than any other secondary school instructor in the United States. He published many contributions in periodicals and made numerous public addresses. He was at various times president of the Head-masters' Association, the Dartmouth Alumni Association, the New England Association of Colleges and Preparatory Schools. Consult *Andover Townsman*, Oct. 11, 1901.

BANCROFT, EDWARD (1744-1820). An American naturalist and chemist. He was born in Westfield, Mass., but at an early age he went to Guiana and there practiced medicine. Later he went to England, where, through the close friendship of Franklin, he obtained a place on the staff of the *Monthly Review*. While holding this position he wrote a series of strong articles in maintenance of American rights and in vindication of Franklin's relation to the *Hutchinson Papers* episode. Charged with arson in 1777, he fled to Paris and became a spy in the employ of the American Commissioners there. It has been commonly charged that he sold information gained from Silas Deane, a former teacher of his, to the British government. There does not seem to be much foundation for this. The reports of the American Commissioners show that he enjoyed their utmost confidence. (Consult Wharton, *Diplomatic Correspondence of the American Revolution*, Washington, 1889.) In 1769 Bancroft published a *Natural History of Guiana* and in 1794 the first volume of an extended work on colors and calico printing, *Experimental Researches concerning the Philosophy of Permanent Colors*. In the meantime (1785) Parliament had granted him special rights of importing and using a certain kind of oak bark in calico printing.

BANCROFT, FREDERIC (1860-). An American historian, born in Galesburg, Ill. He graduated from Amherst College in 1882, received the degree of Ph.D. from Columbia in 1885, and spent several years abroad in study at German and French universities. From 1882 to 1892 he acted as librarian to the Department of State at Washington. At various

times he was lecturer at Amherst College and at Columbia, Johns Hopkins, and Chicago universities on the political and diplomatic history of the United States and Europe. In 1900 he was a delegate to the Congress of Historians at Paris, and in 1902-03 he lectured at the Lowell Institute in Boston on "Life in the South." A member of the literary staff of the *Nation* for many years, he contributed also to other reviews and to magazines articles on historical subjects, and published *The Negro in Politics* (1885); *Life of William H. Seward* (1900); *The Public Life of Carl Schurz*, with William A. Dunning (1908); *Speeches, Correspondence, and Political Papers of Carl Schurz* (1913).

BANCROFT, GEORGE (1800-91). An American historian. He was born at Worcester, Mass., Oct. 3, 1800, and as the son of the Rev. Aaron Bancroft, a Unitarian clergyman, the author of a *Life of Washington*, he inherited the blended qualities of the historian and the ecclesiastic. He was trained at Exeter, N. H.; entered Harvard College at 13, and on his graduation in 1817 went to Göttingen, where he took the degree of Ph.D. in history, being among the first of Americans to study there. His studies were in German, French, and Italian literature, in the classics, Arabic, Hebrew, history, and natural sciences. Leaving Göttingen in 1820, Bancroft went to Berlin, enjoying the society of Schleiermacher, Wilhelm von Humboldt, Varnhagen von Ense, and other distinguished scholars. He studied also at Heidelberg, and on a visit to Jena met the venerable Goethe at Weimar. Returning in 1822 to America, he became tutor in Greek at Harvard and essaying his father's profession, preached occasionally with moderate approval. But literature soon claimed him. In 1823 he published a volume of verse, and with Dr. Joseph G. Cogswell opened a school at Northampton. In the next year he published a translation of his former teacher, Heeren's *Politics of Ancient Greece*, and in 1826 an *Oration*, advocating universal suffrage as the foundation of true democracy. In 1830 he was elected without his knowledge to the Legislature, but he declined to serve and in the next year refused a nomination. Already he was absorbed in his great historical work, *The History of the United States*, of which the first volume appeared in 1834, and the tenth 40 years later. In this form the book was published in 6 volumes (1870-76), 2 concluding volumes (xi and xii) were published (1882) as a *History of the Foundation of the Constitution of the United States*, and the whole appeared in a final revision in 6 volumes (1884-85), as the *History of the United States, from the Discovery of America to the Inauguration of Washington*.

But though this bulky history occupied thus the central position in the labors of a lifetime, it did not engross Bancroft's scholarly activities. In 1830-35 he wrote a *Political Address* to the people of his State, at the request of the Young Men's Democratic Convention, and, giving up his school, moved to Springfield, where he gave himself wholly to historical studies, till, in 1838, he was made Collector of the Port of Boston by President Van Buren. The Democratic party nominated him for governor in 1844. He failed of election by a small margin, and was appointed Secretary of the Navy by President Polk. His management was marked

by the establishment of the Naval Academy at Annapolis, which was devised and organized on his sole initiative by an ingenious straining of executive authority. He also fostered the work of the Washington Observatory and raised the standard of professorial instruction. He showed diplomatic foresight and decision in constantly renewed orders to the American Pacific Squadron to seize California in case hostilities should break out with Mexico—orders executed with far-reaching results. Acting temporarily as Secretary of War, it fell to him to give the command to march troops into Texas. His services at Washington led to his appointment as Minister to Great Britain (1846–49), where he procured modification in the laws of navigation and allegiance. On his return in 1849 Bancroft lived in New York, devoting himself to historical studies, interrupted by diplomatic services as Minister to Prussia in 1867, to the North German Confederation (1868), and to the new German Empire in 1871. From this post he was recalled at his own request in 1874. While Minister at Berlin he assisted in the settlement of the Northwest Boundary dispute between the United States and Great Britain. Oxford made him a D.C.L. in 1849, and Bonn a J.U.D. in 1868. His miscellaneous publications are very numerous. Among the more important may be named an oration at Springfield (July 4, 1836); *History of the Colonization of the United States* (1841); and an oration in commemoration of Andrew Jackson (1844); *The Necessity, the Reality, and the Promise of the Progress of the Human Race* (1850–54); *Memorial Address on Abraham Lincoln* (1866); *A Plea for the Constitution of the United States* (1886); and *Martin Van Buren* (1889). His last address was at the opening of the third meeting of the American Historical Association, April, 1886. His old age was spent in Washington and at his summer home at Newport in charming domesticity. Bancroft was twice married. He died at Washington, D. C., Jan. 17, 1891.

As an historian Bancroft was a democratic idealist. His zeal for justice was deep, but occasionally misdirected; his patience in gathering materials indefatigable; his literary composition labored and frequently over-elaborated. There is a tendency to ponderous expression and to philosophic discursiveness; but though somewhat out of tune with the historic spirit and the literary taste of our own day, his work exercised a very great influence on the generation of the Civil War in stirring and maintaining in the American people the inspiring conception of a continent dedicated to liberty.

Consult: Davis, "George Bancroft," in *American Academy of Arts and Sciences*, vol. xxvi (Boston, 1846–1900); Green, *George Bancroft* (Worcester, 1891); Rives, *Memorial of George Bancroft* (New York, 1892); Schuyler, *Correspondence and Remarks upon Bancroft's History of the Northern Campaign of 1777* (New York, 1867); Wallis, *Mr. Bancroft as an Historian* (Baltimore, 1896); West, *George Bancroft* (New York, 1900). Also the monograph, "A Little More Light on Andrew Johnson," by Prof. William A. Dunning, setting forth the claim that Bancroft wrote the inaugural message and other papers of Andrew Johnson (q.v.). This monograph was published in the *Proceedings of the Massachusetts Historical Society* for November, 1905, and was separately

printed at Cambridge in that year. *Life and Letters of George Bancroft* (ed. M. A. DeW. Howe, Boston, 1908) is biographically of the first importance.

BANCROFT, HUBERT HOWE (1832–). An American historian, born at Granville, Ohio. After entering the book business in Buffalo, N. Y., he was sent to California in 1852 to establish a branch there. He became interested in the history of the Pacific coast and collected documents of all sorts relating to it. His business prospering, he practically retired in 1868 and gave himself up to historical work on a large scale, employing numerous assistants to explore and index his vast collection. He preserved a great mass of material on all phases of the history of the Pacific region, and in 1900 he presented no fewer than 60,000 volumes to the University of California, with about 500 original manuscripts, relating to the pioneer history of the coast. With the aid of his collaborators, he published during the period 1875–87 a monumental "West American Historical Series," 39 volumes in all, covering not only the history of 12 Western States, but that of Central America, Mexico, British Columbia, and Alaska. In addition the complete work includes 5 volumes on *The Native Races of the Pacific States*, and 2 volumes on *The Northwest Coast*. Among other of Bancroft's writings are: *Popular Tribunals* (2 vols.); *Chronicles of the Builders of the Commonwealth* (7 vols., 1891–92); *Essays and Miscellany* (1890); *Some Cities and San Francisco* (1907), and *The Book of Wealth* (1910). An account of his labors is given in *Literary Industries* (1890), continued in *Retrospection, Personal and Political* (1912).

BANCROFT, MARIE EFFIE WILTON, LADY (1839–). An English actress and manager. She was born at Doncaster, and as a child appeared on the stage with her parents, who were both actors. Among her early parts was that of Fleance in *Macbeth* (1846). After several years in the provincial towns she made her London debut, Sept. 15, 1856, at the Lyceum, as the boy Henri, in *Belphegor*, playing the same night in *Perdita; or, the Royal Milkmaid*. She won great popularity in several boy characters, in burlesques at various theatres, as Cupid in two different plays, and notably as Pippo, in the *Maid and the Magpie*, by H. J. Byron, at the Strand Theatre (1858). For several years she remained at the Strand, taking numerous parts of the same general type. In April, 1865, she began, in partnership with Mr. Byron, the management of the Prince of Wales's Theatre, having secured as a leading actor Squire Bancroft (q.v.), whom she had met shortly before in Liverpool. The house soon became noted for its series of successful comedies by T. W. Robertson, realistically depicting certain features of the social life of the day and staged with unusual attention to naturalness of detail. In successive years they brought out *Society* (1865), *Ours* (1866), *Caste* (1867), *Play* (1868), *School* (1869), and *M. P.* (1870). Miss Wilton, who in 1867 became Mrs. Bancroft, regularly took the principal female parts in these pieces, her husband being leading man. Some of her best-known rôles were Mary Netley, in *Ours*; Polly Eccles, in *Caste*; and Naomi Tighe, in *School*; and also Lady Teazle in *The School for Scandal* (revived 1874); Zicka, in *Diplomacy* (1878); and Nan, in *Sweethearts* (1879).

Mr. and Mrs. Bancroft likewise presented at their theatre a number of prominent actors, among them Hare, Coghlan, the Kendals, and Miss Terry. In 1880 they moved to the Haymarket Theatre, a larger house, where they continued the successful presentation of modern comedy. July 20, 1885, they retired from the stage, and very rarely appeared afterward, though in 1893 Mrs. Bancroft took part with her husband (who was knighted in 1897) in the revival of *Diplomacy* at the Garrick Theatre. She collaborated with her husband in the production of two volumes of reminiscences called *Mr. and Mrs. Bancroft On and Off the Stage, Written by Themselves* (London, 1888), and *The Bancrofts: Recollections of Sixty Years* (London, 1909). She is also the author of the novel, *The Shadow of Neeme*.

BANCROFT, RICHARD (1544-1610). An English prelate and Archbishop of Canterbury (1604-10). He was born at Farnworth in Lancashire and was educated at Cambridge, where he graduated B.A. in 1567 and M.A. in 1570. In 1575 he became rector of Fenershams and from this time on became more and more recognized as the leader of the strictly Anglican party as against Puritans on the one hand and Roman Catholics on the other. His opportunity came in the series of attacks on the Anglican church known as the Marprelate Tracts. These he combated by two methods: reply through numerous tracts which he himself wrote or caused others to write; and through bringing offenders to trial before the Ecclesiastical Commission Court, of which he became a member about 1587. In addition to this he delighted the High Church party by a sermon on Feb. 9, 1589, in which he asserted the divine right of bishops and urged the theory of the apostolic succession. His progress was rapid, and he became Bishop of London in 1597 and in this capacity attended the deathbed of Elizabeth. At the accession of James I he did his best to prevent any alliance between the crown and Puritanism and at the Hampden Court Conference (1604) urged the cause of Anglicanism with intemperate zeal. The same year he succeeded in passing through Canterbury Convocation a series of canons aimed at Puritanism which forced many clergymen to give up their livings. Their cause, however, was taken up by Parliament, and for the rest of Bancroft's life a constant struggle was waged between the Puritan Parliament and the archbishops. Not content with this, he involved himself in a struggle with the courts of common law over the rights of the church courts. The balance of his time was spent in the more peaceful work of translating the Bible, of which work he was "Chief Overseer" and which resulted in the "Authorized Version" published the year after his death. He died Nov. 12, 1610. Bancroft was in no sense a lovable person, but the Anglican church undoubtedly owes, in a large measure, her present constitution to this able combative Bishop. Consult Usher, *The Reconstruction of the English Church* (New York, 1910).

BANCROFT, SIR SQUIRE BANCROFT (1841-). An English actor and manager, born in London. He began his dramatic career in Birmingham in 1861. After playing in Dublin and Liverpool he was invited to London by H. J. Byron and Miss Wilton, and made his first appearance at the Prince of Wales's Theatre, in April, 1865. His subsequent history is in con-

stant connection with that of Miss Wilton, whom he married in December, 1867. (See BANCROFT, MARIE.) He continued with Mrs. Bancroft in the management of the Prince of Wales's Theatre and, after 1880, the Haymarket, till July, 1885, when they retired together. After that his chief appearances were at the Lyceum in *The Dead Heart*, with Irving (1889), and in February, 1893, at the Garrick, in *Diplomacy*. * He was knighted in 1897. Consult *Mr. and Mrs. Bancroft On and Off the Stage, Written by Themselves* (London, 1888), and *The Bancrofts: Recollections of Sixty Years* (London, 1909).

BANCROFT, WILDER DWIGHT (1867-). An American chemist, born in Middletown, R. I. He graduated at Harvard in 1888 (A.B.), and did four years of special work in Strassburg, Leipzig, Berlin, and Amsterdam (1889-93). In 1892 he was given the degree of Ph.D. at Leipzig. He was assistant in chemistry at Harvard in 1888-90, instructor in chemistry there in 1894-95. He was assistant profes-

sor of physical chemistry at Cornell in 1895-1903, when he became full professor. In 1905 he was elected president of the American Electro-Chemical Society, and in 1910 of the American Chemical Society. He founded and became editor of the *Journal of Physical Chemistry* in 1895. His publications include *The Phase Rule* (1897).

BAND OF A COLUMN.

BAND (from *bind*). In architecture, the word is used in two senses: (1) to designate any ring or collar encircling a round feature, as a shaft or tower; (2) to designate any flat architectural member continued horizontally along a wall or other part of a structure, such as a flat stringcourse or a frieze. In Gothic, especially English-Gothic architecture, the long shafts of pier clusters are often interrupted by one or two molded bands or shaft rings, and these occur also in Byzantine and Moorish architecture. One of the finest of classic bands is the famous anthemion band of the Erechtheum at Athens.

BAND. Originally the term "band" had general reference to any combination of instruments organized for the performance of instrumental music, in which sense it is still largely employed in England. In modern technical usage it refers only to such combinations of instruments as are usually played on the march. Up to the twelfth century there had been no attempt at musical organization on the part of wandering or roving musicians—a condition due as much to the evil repute in which they were held as to the unsuitable character of their primitive instruments. About the thirteenth century conditions had so far improved that recognition and sanction were conceded them, and bands of pipers and trumpeters came into existence.

So seriously did they value their art after this that guilds were formed, the members of which elected a head or piper king, who, in common with the rank and file of the membership, was pledged to see "that no player, whether he be piper, drummer, fiddler, trumpeter, or performer on any instrument, be allowed to accept engagements of any kind, whether in towns, villages, or hamlets, unless he had previously enrolled himself in the guild." The original guild was probably that of the Brotherhood of St. Nicholas, organized at Vienna in 1228, which 100 years later was placed under the control of a regularly appointed board nominated by the Austrian government. From these guilds town bands were formed throughout Germany and Austria, consisting for the most part of fifes, flutes, schalmey, bombard, zinkers, or cornetti (six-holed horns, similar in shape to a cow's horn, and played with a special mouth-piece), bagpipes, viols, and drums. The development of the wind band (brass, wood wind, and reed instruments) was curiously influenced by the peculiar restrictions defining the social status of every calling during the Middle Ages. Thus, the trumpets and kettledrums were reserved exclusively for the nobility and forbidden to ordinary minstrels. In some towns stringent laws were passed forbidding bands of more than five or six pipers to play at an ordinary citizen's wedding, or other functions of similar importance; bands of greater strength, or the *full band*, being reserved for civic and religious occasions. The music played by such bands was learned by ear and rarely put into writing, in order to add effect to the supposedly secret nature of their order. Between the seventeenth and eighteenth centuries music began to be noted down, and the monotonous character of the band music (due to the impossibility of their horns and trumpets giving the third and seventh of the dominant chord) was largely done away with by adding a few trumpets tuned in other keys.

At the beginning of the eighteenth century instrumental music had separated very distinctly into the three or four great groups or divisions in which we find it to-day. The *full orchestra*, combining every element and vehicle of musical expression, addressed itself to the musical intellects; while the *brass band* retained its mission as church and community music, especially for rendering chorales in the open air, and the *military band* appealed to the masses at large. The bands of to-day may be grouped as follows: (a) drum and fife, or drum and bugle; (b) brass band; (c) military band. Drums, fifes, and bugles or trumpets have remained practically unchanged, and are now, as they always have been, inseparably connected with all that pertains to the life of the soldier. The brass band has ever been closely connected with the services of the Church, and in England has reached its highest development through the numerous workmen's band organizations of Lancashire and Yorkshire. Such bands as *Besses-o-th'-Barn*, *Stalybridge Old Band* (under Alexander Owen, a celebrated leader), and similar bodies, in many instances composed entirely of coal miners or factory operatives, have been reckoned among the most potent influences in the modern development of music among the masses of England. Brass bands are met with in the United States, but only where military bands are not possible.

The military band as a musical organization (as a regimental or military feature, it will be found treated under *BAND, MILITARY*) is the modern representative of the original town band. The first French military bands, organized by Lully (q.v.) under the commission of Louis XIV, consisted of a quartet (soprano, alto, tenor, and bass) of oboes, with regimental drums, for all of which he wrote separate parts. The music of the town bands was performed by all the instruments in unison. Queen Elizabeth's band had consisted of 10 trumpets and 6 trombones, besides a few other instruments. The Lully of the Germans was a civilian musician named Wicprecht, who, because of severe opposition, succeeded in getting his scheme of instrumentation introduced into but a single Prussian regiment. Sax (q.v.) of France succeeded in the introduction of similar reforms in the army of Napoleon III. The invention and rapid improvement of the clarinet marked a new era, and it became as important and essential a feature of the military band as is the violin to the orchestra. Next followed the invention of the bassoon (or *fagotto*) and French horns. The saxophone family (B flat soprano, F flat alto, B flat tenor, E flat barytone, and B flat bass), although practically the invention of the French bandmaster Sax, have only within the last few years become common to military bands generally.

The modern *concert military band* may be described as a result of the following causes: (1) a development of the brass band; (2) a desire to give more complete artistic expression to the increasing repertoire of band music; (3) the prominence given to the wind band, in the composition of the great modern orchestral composers. To the latter cause, and to the easy transition from orchestra to band of most modern orchestral compositions, may be indirectly attributed the great increase of the woodwind section of the concert band—flutes, oboes, clarinets, and contrabassoons (*contra fagotti*). An instance of this may be found in Wagner's "Elizabeth's Prayer," where the wood winds are used alone. Similarly, in many of the most beautiful passages of the Nibelungen music, the strings are not used at all. The reflex influence of such music on the concert band has been to cause the invention and introduction of new instruments, in order to secure the desired tone color. The military concert band has received its greatest impetus in the United States, where it may be said to have been inaugurated in the Fourth of July concerts given by the Boston city government as a feature of the regular Independence Day celebration usually held on the historic Common. The series of promenade concerts which followed met with remarkable success, and brought Patrick Sarsfield Gilmore (q.v.) into prominence as a bandmaster. D. W. Reeves succeeded Gilmore at the latter's death, but soon resigned in favor of Victor Herbert, who is held to have rivaled John Philip Sousa (q.v.) in the advancement of the military band. The organization known as Sousa's Band, marked at the beginning of the twentieth century what was universally regarded to be the highest type of concert military band. Sousa, who had attained national eminence in connection with the United States Marine Band at Washington, resigned his position in order to devote himself to concert work entirely, with a band whose membership was as carefully recruited as that of the great orchestras. The

band of the French Garde Républicaine was his model, and he has succeeded in placing his organization at the head of the concert bands of the world.

Band Instrumentation for brass, military, and concert bands is as follows: *Brass* (if of 10 pieces), E flat tuba, barytone, 2d alto, B flat tenor, E flat cornet, 1st alto, 2d B flat cornet, 1st B flat cornet, bass drums and snare drum. For a band of 20 pieces the following instruments are added: 1 solo, A flat cornet, and 2 1st B flat cornets; 1 3d B flat cornet; 1st, 2d, and 3d trombones, and 1 B flat bass. The average military band is composed as follows: 2 1st B flat clarinets; 2 seconds, and 1 3d B flat clarinet, 1 piccolo, 1 E flat clarinet, 2 1st B flat cornets, 1 2d and 1 3d B flat cornets, 1st, 2d, and 3d altos, 1st, 2d, and 3d trombones, oboe, glockenspiel, saxophones (occasionally), barytone, B flat bass, E flat tuba, bass drum and snare drum. The concert military band includes such additions to the regular military band as are demanded by the programme undertaken. String bass, glockenspiel, saxophones, contra-fagotti, and tympani are invariably added. Consult A. A. Clappé, *The Wind Band and its Instruments* (New York, 1911).

BAND, MILITARY. In the army service, an organized body of musicians, instrumentalists, under a bandmaster or chief musician, generally assigned to each regiment of cavalry and infantry, and to the headquarters of the branches of the service. Military bands of one form or another are coeval with military bodies themselves. Every ancient nation had its peculiar music, instruments, and national songs. If tradition assigns the reed, lute, and string to the shepherd and herdsman, it is no less the authority for imputing the jarring instruments of percussion and strident brass to men of war. Ancient songs referred invariably to great victories, memorable sieges, and valorous deeds, and were sung in camp and on the march. With the Spartans the song of Castor was the signal for combat; the Romans charged to the musical accompaniment of trumpets and horns; while the ancient Germans preferred the more complex aggregation of drums, flutes, cymbals, and clarions. At the beginning of the period of the Middle Ages the instruments handed down and preserved by most European nations were those used in the rallying of troops, calling them to battle, or enlivening a fatiguing march with the few crude melodies of which they were capable.

In France the minstrels and troubadours greatly aided instrumental progression. They would frequently accompany the troops on the march and to battle, having as instruments the rebec, a small, three-stringed violin; the bagpipe, and the flute, or fife, to which, in 1330, was added the clarion. The cornet, another war instrument of the ancients, made its appearance about the same time. Towards the end of the fifteenth century regularly organized military bands began to make their appearance, their collection of instruments comprising drums and trumpets principally, which, in the case of the Italian bands, was further augmented by the pandean pipes, together with the flute and fife. The drummer used a single stick. Bagpipes and violins were added about the beginning of the sixteenth century, the invention of the former instrument belonging to the Alps or Piedmontese inhabitants.

The Swiss mercenaries, in 1535, introduced

into France the combination of fife and drum, which has ever since and in nearly every land been the popular musical vehicle for the expression of martial spirit.

In the seventeenth century the Prussians introduced the hautboy, which was given to the dragoons and musketeers of the Guard. To the Eastern nations, through the Hungarians, we owe the kettledrums, bassoon, and true flute; to the Italians the tambourine; to the Hanoverians the modern horn; and to the Turks the cymbals and big drum. The entire musical scheme of military bands at the beginning of the eighteenth century was a combination of all these instruments, with the addition of the cavalry trumpet. The average infantry band consisted of drums, fife, horn, bassoon, big drum, and cymbals; the cavalry bands of hautboy, bagpipe, and kettledrums. The bassoon, hautboy, horn, and trumpet, however, were indifferently employed by both troops. A French ordinance dated April 19, 1766, appoints a band of music to each regiment. New instruments making their appearance are: the clarinet (q.v.), which, however, is not incorporated into the band until 1755; the serpent, triangle, and trombone, each entering successively and from different sources. Practically it was not until 1792 that military music and military bands began the development that has brought them to their present high state of efficiency. In England officers hired civilian musicians to act as the band of their respective regiments—a system which obtained until the foundation of Kneller Hall (q.v.) in 1857; but in France and Russia bands were part of the army organization. About this time the individual bandmaster becomes prominent as the great factor of progress, among the most important of whom must be placed the famous Neithardt, born Aug. 10, 1793, who, when still a young man, was for two years bandmaster of the Garde-Schützen Battalion, and afterward for 20 years the bandmaster of the Kaiser-Franz Grenadiers. This latter band he brought to a high state of perfection. Progress in England must be credited largely to Charles Godfrey, born 1790, who in 1813 joined the band of the Coldstream Guards as a bassoon player, became bandmaster, and remained such until his death in 1863. In the United States Patrick Sarsfield Gilmore (q.v.) was the moving spirit. His first band was organized in Boston, 1859, but shortly afterward he became a bandmaster in the Federal army, serving throughout the Civil War, and becoming world-famous for the novel effects he produced in military music. Bands in the United States army are recruited generally for that specific purpose, the members being enlisted men, and usually consist of 28 men, all ranks. (For their pay, see PAY AND ALLOWANCES.) Instruments are supplied by the Quartermaster's Department. There is a school for army bands at Governor's Island, N. Y., which is more or less experimental in character, but it is hoped that a permanent school for training young men and boys for bands of the United States army will be developed from it, the scheme employed in England being the prospective plan.

In England bandmasters are specially trained at Kneller Hall, and on appointment receive warrant rank, with pay at 5 shillings per day, and £70 per annum from the band fund. The men are generally recruited as boys, from 14 to 16 years of age, usually from military institu-

tions, schools, and training ships. The official establishment of British army bands is 31 all told for infantry, and 23 for cavalry; but without exception this number is greatly increased at the personal expense of the officers of the regiments, who pay for all extra men, music, and instruments. A thoroughly trained, fully equipped, numerically strong band is often a point of regimental rivalry, and while it has succeeded in endowing the British army with the best bands in Europe on an average, it has been done only at the expense of officers, already financially overtaxed. The following bands are considered among the leading military bands of Europe: the Royal Artillery, Royal Marine, and Guards Band, of England; the Kaiser-Franz Grenadier Band, of Germany; the Guides Band, of Belgium; the Garde Républicaine Band, of France; the Imperial Guards Band, of Austria; the Ottoman Palace Band, of Turkey; the Bersaglieri Band, of Italy; the Czar's Regiment of Guards Band, of Russia.

For fuller details the reader is referred to *United States Army Regulations* for composition and equipment of United States army bands; Grove, *Dictionary of Music* (London, 1894), for biographies of military music composers and bandmasters; and the article "Militärmusik," by Rode, in the *Musikalisches Conversations-Lexicon* (Berlin, 1877).

BAN'DAGE (Fr. from *bande*, a strip; cf. *BAND*). A strip of woven material used by surgeons to apply pressure on a part or to re-

a spiral, each turn overlapping the preceding about one-third of its width and adjusted to tapering or enlarging parts of the limb by reversing the bandage, or turning it back upon itself. It must be applied smoothly, so as to exert even pressure. A "figure-of-eight" bandage is often used in the neighborhood of joints, the turns crossing each other in a way to resemble that numeral. The "spica" bandage, so called from its supposed resemblance to the arrangement of the husks of an ear of corn, is applied at the junction of a limb with the body; 3, in the figure, illustrates a spica of the groin. There are also bandages to suit special purposes, as the four-tailed for the head or knee, which consists of a piece of cloth split up on each side towards and nearly to the centre. When applied, the tails are crossed and tied so as to make an extemporaneous nightcap. In the packets supplied to soldiers of the German army and to members of an ambulance corps, as well as to members of "first aid to the injured" societies, are large handkerchiefs, to be used as triangular (Esmarch) bandages, slings, or, when folded, short roller bandages. Roller bandages of crinoline, rubbed full of fresh plaster of Paris, are used in making plaster splints in case of fracture, etc. They are thoroughly wet first and then applied rapidly. Starch, silica, and dextrin bandages are used in much the same manner to secure stiff and immobile dressings. India-rubber bandages are employed, on the other hand, where a flexible support is required, as in varicose veins of the legs.

BANDAI-SAN, bân-dâ'-sân' (Jap. Bandai mountain). A volcano of Japan, situated near the centre of the island of Nippon (Map: Japan, F 5). It consists of a number of peaks, none of which exceed a height of 6000 feet, situated around an elevated plain, on the northern side of Lake Iwanashiro. The last eruption of the volcano occurred on July 15, 1888, when a tremendous mass of earth and rock was thrown out by the explosion of one of the craters, Ko-Bandai-san, and rolled down the mountain slopes into the Nagase valley, devastating an area of over 27 square miles and killing 461 people.

BANDA (bân'dà) **ISLANDS**. A group of several small islands of the Dutch East Indies, in the Moluccas (q.v.) south of Ceram and attached to the residency of Amboina (Map: Australasia, E 3). The two largest islands are Banda Neira and Lontor. Gunong Api, the highest island, is an active volcano 2200 feet above the sea, constantly emitting vapor and sometimes doing great damage. Only a few of the islands are inhabited. Their total area is about 17 square miles, and the main products are nutmegs and mace. The capital is Banda, on Banda Neira. It is well fortified and has a good harbor. The population of the islands is about 9500, of whom about 500 are Europeans. The Banda Islands were discovered in 1512 by the Portuguese, who were possessed by the Dutch in the seventeenth century. Since then they have shared the fortune of the other Moluccas. Consult Warburg, *Ein Beitrag zur Kulturgeschichte der Banda-Inseln* (Leipzig, 1897).

BANDAN'A (Hind. *bāndhnū*, from the dyeing of wares with those parts tied [*bāndh*, cord, tie, band] that are to remain undyed). A printed handkerchief, originally of Indian origin and manufacture and usually made of cotton, though real Indian bandana silks and handkerchiefs are

BANDAGES APPLIED.

Roller Bandages: 1, eye; 2, finger, wrist, and forearm; 3, groin; 4, knee-cap; 5, foot and ankle. Triangular Bandages: 6 and 7, shoulder; 8, upper-arm; 9, hand; 10, leg.

tain dressings upon wounds. The most common bandage is a strip of linen, flannel, muslin, or cheese cloth, from 1 to 5 or more inches in breadth and 10 yards long, rolled longitudinally: the roller bandage. It is applied to a limb in

occasionally seen. The cloth is first dyed turkey-red, and then the pattern is made by discharging the color with bleaching liquor in a hydraulic press. The pattern to be discharged is cut out on two plates of some metal, such as lead, which is not acted on by the liquor, the plates being the full size of the handkerchief. A dozen or more handkerchiefs are put in at once between the plates, and so many of these courses are entered together as will fill the press. Then the pressure is applied, and the liquor is run in on the uppermost plate, which is grooved on the upper side to receive it, and holed to pass it from plate to plate through all the cloth folds in the press. The pressure on the cloth to make clean work by preventing the spreading of the liquor is enormous. The patterns in the real bandana style of printing are spots and diamond prints, the best suited for discharging, and even for these a pressure of 500 tons is required to work them clean.

BANDA ORIENTAL, bân'dâ ô'râ-ên-tâl' (Sp. eastern bank). A name once locally used to designate the republic of Uruguay, which is on the east side of the Uruguay River.

BANDEL, bân'dêl, ERNST VON (1800-76). A German sculptor. He was born at Ansbach and studied at the Munich Academy. After some years in Nuremberg and Rome he returned to Munich, where he carved portrait busts. In 1834 he went to Hanover and undertook, among other larger works, the colossal statue of the German hero Hermann or Arminius at Detmold, to which he devoted the best years of his life and a large part of his own resources. In 1871 the Imperial government contributed 10,000 thalers to the work, and the statue was unveiled in 1875, the sculptor receiving a pension of 12,000 marks in recognition of his devoted services. Although Bandel was educated in the classic school, he nevertheless endeavored to free himself from its influence, as well as to hold himself aloof from the Romantic tendencies of his day. His aim was to found a national school of sculpture based upon naturalism, but his individuality was not sufficiently powerful to break the bonds of classicism. Consult his own monograph, *Die Arminiusale* (Hanover, 1861), and his biography by Schmidt (Hanover, 1892).

BANDELIER, bân'de-lêr', ADOLPH FRANCIS ALPHONSE (1840-1914). An American archaeologist, born at Bern, Switzerland. He traveled under the direction of the Archaeological Institute of America in New Mexico, Arizona, Mexico, and Central America, 1880-85, and went in 1892 to Peru, Bolivia, and Ecuador, under commission of Henry Villard. For several years he continued researches in the last-named countries in behalf of the American Museum of Natural History in New York City, whose important collection of Bolivian and Peruvian antiquities he made. In 1904 he was appointed lecturer in American Archaeology at Columbia University and served until 1911. Among numerous other works of investigation he published *The Art of War and Mode of Warfare* (1877); *Archaeological Reconnaissance in Mexico* (1881); *Final Reports of Investigations among the Indians of the Southwestern United States, 1880-85* (1890-92); *The Gilded Man (El Dorado) and Other Pictures of the Spanish Occupancy of America* (1893); *On the Relative Antiquity of Ancient Peruvian Burials* (1904); *The Indians and Aboriginal Ruins of Chacha-*

poyas, Peru (1907); *The Islands of Titicaca and Koati* (1910).

BANDELLO, bân-dêl'ô, MATTEO (c.1485-c.1560). Next to Boccaccio, the most widely known of all the Italian writers of *novelle*, or tales. He was born at Castelnovo in Piedmont, educated at a convent in Milan, and in early life became a Dominican monk. After several years of wandering through the courts of the south, he settled at Mantua (1515), where under the patronage of the Gonzaga family he made many powerful friendships. In 1521 he returned to Milan, where he remained till 1526, when his connection with the Morone conspiracy forced him to flee. At first secretary to Luigi Gonzaga, he served from c.1528 to 1541 as adviser of Cesare Fregoso. After the murder of the latter he accompanied Fregoso's wife to France. Her influence in 1550 procured him the bishopric of Agen, which he held till 1554. He continued for the rest of his life in France. Not to consider his *Rime* (1537), dedicated to his idealistic love for Lucrezia Gonzaga, and his 11 cantos of *Lodi* (1545) in her honor, Bandello's most important work is his *Novelle* (vols. i-iii, 1554; vol. iv, 1573). These tales belong to the type made familiar by the still more famous collections of the *Decameron* and the *Heptameron*, and have their origin in the conversations which Bandello attended in the long course of his social life. They deal with the tales made familiar in the French *fabliaux*, with popular traditions and anecdotes, historical episodes, the events of current life; and are narrated in a simple conversational style, much as they were actually told in intimate social intercourse. Bandello has little psychological penetration and no power over the comic, but he has a marked sense for the picturesque and a naive interest in the strange and fantastic. Together with the introductory notes, which describe the occasions on which Bandello heard the tales, his stories give valuable insight into the social life and manners of his time. He narrates, among others, the story of Romeo and Juliet, though Shakespeare probably derived his plot from another source. His work has been used extensively by Lope de Vega, Massinger, and Byron. Consult E. Masi, *M. Bandello o vita italiana in un novelliere del '500* (Bologna, 1900). The tales were translated by J. Payne (London, 1890); the best edition of the *Novelle* is that of Brognoligo in 6 vols. (Bari, 1910-12).

BANDE NOIRE, bând nwâr (Fr. black band). The name given in France after 1815 to those speculators who had bought up, at ridiculously low prices and in depreciated currency, the lands and houses confiscated from the Church and the émigrés during the Revolution. The opprobrious name was fixed on them on account of their vandalism in the destruction of magnificent works of art, churches, convents, and chateaus for the sake of the building material. It has, however, been affirmed that these men did considerable service to the community in removing old and useless edifices, and that their minute subdivisions into lots of the old territorial domains has favored agriculture and ameliorated the condition of the people. Consult Laverigne, *Economie rurale de la France* (Paris, 1877).

BAN'DEROLE (Fr., It. *banderuola*, a little banner, dimin. of *bandiera*, banner). A small streamer fixed immediately under the crook, on the top of a staff of a crozier and folding over

the staff. Also an architectural term for the flat inscribed band used in the Renaissance buildings, similar to those now used for mottoes on coats of arms.

BANDETTINI, bân'dêt-tê'nê, TERESA (1763-1837), called also in the academies AMARILLA ETRUSCA. An Italian *improvisatrice*, born at Lucca, whose beauty, wit, and skill at extempore versifying made her famous in the academies of Italy and won her the laurel crown of poetry in Rome (1794). She was a friend of Monti and Alfieri and one of the leading people of the day.

BAND FISH. One of the several greatly compressed and much elongated marine fishes, principally of the family Cepolidae. The red band fish (*Cepola rubescens*), about 15 inches long, dwells in the Mediterranean, where, on account of its brilliancy, it is sometimes known as the "fire-flame" and "red-ribbon." Species also occur in Asiatic waters, inhabiting quiet depths, where they are free from the action of the waves, feeding on seaweed and small shellfish. The name is also sometimes applied to the oarfish (q.v.).

BANDHOLTZ, HARRY HILL (1864-). An American soldier, born at Constantine, Mich. After graduating from the United States Military Academy in 1890 he rose steadily through the various grades, serving as major of volunteers with the Seventh Infantry in the Santiago campaign of the Spanish-American War, and as captain with the Second Infantry in the Philippine insurrection campaigns. In 1901-02 he was governor of Tayabas Province, and afterward he became assistant chief of the Philippine constabulary, in command of the district of southern Luzon. In 1907 he was promoted to be brigadier-general and chief of the Philippine constabulary. In the discharge of his duties he captured or destroyed various outlaw bands and their chiefs, the last of whom he successfully subdued in 1911.

BAN'DICOOT (a corruption of the Telugu word *pandi-kopper*, meaning 'pig-rat'). A member of the marsupial genus *Perameles*, included in the family Peramelidae. The species are not numerous, about 12 in all, and are scattered through Australasia. The muzzle is long and pointed and the head shrew-like. Much of the day is passed in burrows in which they make nests of grass and leaves. They feed both on insect food and vegetables. Their powerful claws enable them to dig up roots with ease, and they frequently do great damage to the gardens of the outlying settlements. The pouch opens backward and has accommodation for six or eight young. The long-nosed bandicoot (*Perameles nasuta*) is about 20 inches long, including a 5-inch tail. "It has ears like a rabbit, a long, sharp nose like a shrew, hind quarters like a kangaroo, and tail like a rat."

The closely related rabbit bandicoots consist of two Australian marsupials of the genus *Peragale*. The best-known form (*Peragale lagotis*) is known in its western Australian home as "native rabbit," from its enormous ears. The form, gait, and even the flavor of the flesh are rabbit-like. It burrows in the soil for grubs and also feeds on grass and vegetables. The pig-footed bandicoot (*Charopus costanotis*) is the only member of its genus. It differs from other bandicoots and resembles a pig in having but two functional toes on each foot. It is small in size and omnivorous.

BAN'DICOOT RAT. The largest-known

species of rat (*Nesokia bandicota*), a native of India and Ceylon, where it is also known as Malabar rat and pig rat, the latter being the significance of the Telugu word of which *bandicoot* is a corruption. Its body often exceeds a foot in length, the tail being of equal length. It is black above and grayish beneath, and the long tail is very thick at the base. It frequents arid, hilly districts, where its flesh is a favorite article of food with the coolies and is said to be delicate in flavor and to resemble young pork. It feeds chiefly on grain and roots and is very destructive to gardens and to poultry, burrowing under walls to reach what it wants. "Its nests, when rifled, are frequently found to contain considerable quantities of rice, stored up against the dry season." It is not known north of the Ganges and Indus. Other species of the genus extend from Palestine to Formosa.

BANDIERA, bân-dyâ'ra, ATTILIO and EMILIO (1817 and 1819-44). Italian patriots. The two brothers came of a noble Venetian family; their father was an admiral in the Austrian service, and they themselves were officers of rank in the navy. Out of zeal for the cause of Italian independence, they entered into conspiracies against the Austrian government and carried on a correspondence with Mazzini, their idol, who was then in exile in England. In 1844 they were forced to flee to Corfu, whence they returned in the hope of stirring up an insurrection in Calabria. They were betrayed to the police authorities and, with seven of their companions, captured as soon as they had landed. On July 25, 1844, they were shot in the market place of Cosenza, while singing patriotic hymns and exclaiming "Viva l'Italia!" The death of the two noble youths aroused the hatred of Liberal Europe against the Austrian tyranny in Italy and prepared the way for the first movement of liberation in 1848. Consult Ricciardi, *Storia dei fratelli Bandiera e consorti* (Florence, 1863).

BANDINELLI, bân'dê-nê'l'lê, BARTOLOMMEO, or BACCIO (1488-1560). An Italian sculptor. He was born at Florence and was a pupil of his father, Michelangelo di Viviano, an able goldsmith, and of Rustici. He imitated the works of Michelangelo, whose "David," symbolic of Florentine freedom, he, the protégé of the Medici, attempted to surpass with a "Hercules and Cacus" (1534), placed like it in front of the Palazzo Pubblico. Ugly and exaggerated in form and sentiment, this group succeeded only in making its author the object of satire and ridicule. But Vasari's generally accepted charge that Bandinelli destroyed Michelangelo's famous cartoon of the "Bathing Soldiers" is probably due to that author's dislike of him. Through his industry many Italian cities were adorned with his statues and river gods, but their treatment was so commonplace that they failed to elevate or inspire public taste. His best work is to be found in the marble choir screen of the cathedral at Florence, wherein he has personified, in relief, figures of the virtues and figures of prophets and apostles. There is grace in their conception, and they are intelligently arranged as to the space at command. In the choir of the Annunziata at Florence is a group representing "Nicodemus Supporting Christ"; the Nicodemus is a portrait of Bandinelli himself. His other works include "Adam and Eve" and "Bacchus" (National Museum, Florence).

BAND OF HOPE UNION. The most important of the children's temperance societies

of England, started with local unions in 1847. In 1855 the United Kingdom Band of Hope Union was formed, and later the Edinburgh, Scottish, and Hibernian unions. With the income derived from small weekly dues, they maintain lectures, agents, a publishing department, fêtes, and concerts. Illustrated lectures are given in elementary and common schools, institutions, reformatories, and workhouses. Children over seven years old may belong. The latest statistics indicate that there are over 15,000 Bands of Hope and juvenile temperance societies in Great Britain, with a membership of about 2,000,000. See TEMPERANCE.

BAN'DOLIER', or **BANDOLEER** (Fr. *bandoulière*, It. *bandoliera*, shoulder belt; cf. *band*). A cartridge belt, worn over the shoulder; strongly made of stout canvas cloth, with a separate pocket for each cartridge or round of ammunition. It was extensively used by the colonial troops of Great Britain and portions of the mounted infantry, and officers armed with the revolver, during the Boer War of 1899-1902. The first use of the bandolier as an article of military equipment dates back two centuries, when muskets were provided with matchlocks. The musketeers were furnished with gunpowder in small cylindrical boxes made of wood, tin, or leather, each containing sufficient for one charge. Twelve of these little boxes were fixed to a belt called a bandolier, worn over the left shoulder. Ammunition for the rifle is issued to troops of the United States army in bandoliers, each containing 60 rounds. Each bandolier is fitted with a sling suitable for carrying it over the shoulder. The bandoliers are packed in moisture-proof containers, each holding 20 bandoliers filled with cartridges.

BAN'DON, or **BAN'DONBRIDGE**. A town in county Cork, Ireland, on the Bandon, 20 miles by rail southwest of Cork (Map: Ireland, C 5). Bandon was at one time a prosperous manufacturing town, with extensive cotton-spinning and weaving industries, which now have almost entirely disappeared; a considerable grain and provision trade is carried on, and there are flour mills and breweries, but the population, which was 9049 in 1841, had diminished by 1911 to 3122. The country around Bandon is very beautiful, well wooded, undulating, and pastoral. The river described by Spenser as "the pleasantest Bandon, crowned by many a wood," has a course of 40 miles, 15 of which are navigable to Innishannon, 5 miles below Bandon.

BANDONG, bän'dông. The capital of the Preanger residency in Java, situated in the western part of the island, and connected by rail with Batavia (Map: East Indies, C 6). It contains a fine park and plain in front of the regent's residence, a school for native teachers, and a racecourse. The volcano of Guntur is near by. Pop., estimated at 21,200.

BANDTKE, bant'ke, or **BANDTKIE**, bant'kye, JERZY SAMUEL (1768-1835). A Polish historian, philologist, and bibliographer. He was born at Lublin and was educated at Halle and Jena. From 1811 until his death he was librarian and professor at Cracow. He wrote several valuable works, among which may be mentioned *Polnisch-Deutsches Wörterbuch* (1806), *Polnische Grammatik für Deutsche* (1808; frequently reprinted), and *Dzieje narodu polskiego*, 'History of the Polish Nation' (1810; 3d ed., 1835).

BANDY LEG. See LEG.

BANE'BER'RY. See ACTÆA.

BANÉR, bā-nār', JOHAN (1596-1641). A Swedish general in the Thirty Years' War. He was born at Djursholm, near Stockholm, entered the army in 1615, and early distinguished himself in the wars against Russia and Poland. He accompanied Gustavus Adolphus to Germany in 1630 and was conspicuous in the battle of Breitenfeld (1631), in which he repulsed Pappenheim and largely contributed to the victory. He was left to oppose Aldringer in the west when the battle of Lutzen was fought (1632), and after the death of Gustavus Adolphus he assumed chief command of the Swedish army, invaded Germany with varying success, obtaining decisive victories at Wittstock (1636) and Chemnitz (1639). He failed in an attempt, in 1641, to capture the Emperor at Ratisbon and died soon afterward at Halberstadt. Consult C. F. Manderfeldt, *Eloge de Jean Banér, feld-marechal général pendant la guerre de trente ans* (Copenhagen, 1787), and Lundblad, *Johan Banér* (Stockholm, 1823).

BANES, bā'nās. A town on the north coast of Cuba, in the province of Santiago de Cuba, about 35 miles north by east of Holguin (Map: Cuba, K 6). It has an excellent harbor and is noted for its shipments of fruit, especially bananas.

BANFF, bām'f. A seaport and the county town of Banffshire, Scotland, at the mouth of the Deveron, 50 miles by rail north-northwest of Aberdeen (Map: Scotland, F 2). It forms a higher or inland town, and a lower or sea town, on the Moray Firth. The town is very well built, and the streets are clean and well paved. Among the noteworthy buildings are Banff Castle, a handsome town hall with a lofty spire, and the academy, a fine building of classical style. There are a number of educational institutions, including a museum and several libraries. To the south of Banff is Duff House, the seat of the late Duke of Fife, with a large park. A seven-arched bridge over the Deveron unites Banff with the seaport of Macduff, on the right bank of the river. Manufactures include beer, and leather, wool, and iron goods. The chief exports are grain, agricultural products, cattle, salmon, and herrings. Banff, with Macduff, Elgin, Cullen, Inverary, Kintore, and Peterhead, sends one member to Parliament. Population, royal and municipal burgh, 1901, 3730; 1911, 3821. Its earliest-known charter was granted by Malcolm IV about 1163. Robert II in 1372 made Banff a royal burgh. Archbishop James Sharp was born here in 1618. Consult Cramond, *The Annals of Banff* (Aberdeen, 1891-93).

BANFF, bām'f. A popular health and pleasure resort in southwestern Alberta, Canada, on the Bow River and on the Canadian Pacific Railroad (Map: British Columbia, F 4). The village (pop., 937 in 1911) is situated amid grand scenery of the Rocky Mountains and has a boiling sulphur spring, open-air swimming baths, a fine hotel, and a sanitarium, all included in the Rocky Mountain National Park of Canada (area, over 5000 square miles), of which Banff is the railway depot. Consult *Banff in the Canadian Rockies* (Montreal, 1900).

BANFFSHIRE, bām'f'shēr. A county in the northeast division of Scotland, bounded north by the Moray Firth; east, southeast, and south by Aberdeenshire; west, by Elgin and Inverness shires (Map: Scotland, E 2). Its greatest

length is about 59 miles, its greatest breadth about 31, its extent of seacoast about 30; area, 630 square miles. The surface is mountainous, interspersed with fertile valleys and fine pastures. The soil in many parts is very fertile and highly cultivated. Agriculture and herring and salmon fisheries are the leading occupations. The chief towns and villages are Banff, Macduff, Keith, and Buckie. Pop., 1801, 35,807; 1851, 54,170; 1891, 64,190; 1901, 61,500; 1911, 61,402.

BANFFY, bän'fë, DESIDERIUS, BARON (1843-1911). A Hungarian statesman. He was born at Klausenburg, Transylvania, and educated at the universities of Leipzig and Berlin. He entered the government service and became prefect (*Obergespan*) of various counties of Transylvania. He was elected deputy and became President of the House of Deputies in 1892. On the resignation of the Wekerle cabinet in 1895 he was intrusted with the formation of a new Liberal ministry. He resigned both the premiership and his mandate as deputy in 1899, but re-entered politics in 1903 as head of a new party advocating radical nationalistic views. He was a member of the coalition which brought parliamentary government to a standstill in 1905-06, but succeeded in the spring of 1906. See HUNGARY.

BANG, bäng, BERNHARD LAURITS FREDERIK (1848-). A Danish scientist, professor of pathology and therapy in the Royal Veterinary and Agricultural College at Copenhagen. He became widely known for his researches in veterinary science, and especially for his investigations into contagious abortion and tuberculosis. With Stribolt he discovered, in 1896, the cause of contagious abortion in cattle, and subsequently he studied its treatment and the possibility of immunization. In 1892 he originated the Bang method of eradicating tuberculosis from dairy herds by the isolation of the mildly affected animals and the artificial feeding of their calves with milk free from tubercle bacilli. This method has been extensively applied in Denmark, Sweden, and Norway, with favorable results. Bang is the author of a large number of articles in the veterinary and other scientific journals of the world.

BANG, HERMANN JOACHIM (1857-1912). A Danish author, a nephew of Olaf Lundt, born in the island of Seeland and educated at the Academy of Sorö and at Copenhagen. He wrote the following popular novels, tales, and romances: *Haabløse Slagter* (1880; Ger. trans., *Hoffnungslose Geschlechter*, 1900); *Fadra* (1883; dramatized as *Ellen Urne*, 1885); *Excentriske Noveller* (1885); *Stille Eksistenser* (1886); *Tine* (1889); *Under Aaget*, a collection of novels (1890); *Ti Aar* (Ger. trans., *Zehn Jahre*, 1891); *Teatret* (1892); *De fire Djævole* (1895; Ger. trans., *Die Vier Teufel*, 1897); *Ludrugsbakke* (1896); *Det hvide Hus* (1898; Ger. trans., *Das weisse Haus*, 1902); *Vad Vejen*, considered his best novel (Ger. trans., *Am Wege*, 1898); *Udvalgte Fortællinger* (1899); *Liv og Dod* (1900; Ger. trans., *Leben und Tod*, 1901); *Englen Michael* (1902); *Joseph Kainz* (1910). Etta Federn published a collection of Bang's fiction in German in 1910.

BANG, PEDER GEORG (1797-1861). A distinguished Danish jurist and statesman. He was born at Copenhagen and in 1830 was appointed professor of law in the university there. He took an active interest in politics, rising from offices in his native city to be a national figure. Several times he was Minister

of Agriculture and Minister of the Interior, and in 1854 he was made head of the cabinet. His highest post was that of Supreme Court justiciary. His two principal works are *Lærebog i de til den romerske privat Ret henhørende Discipliner* (2 vols., 1833-35) and *Systematisk Fremstilling af den danske Procesmaade* (with J. C. Larsen, 5 vols., 1841-43). His uncle, Frederick Ludvig Bang (1747-1820), was a distinguished professor of medicine at the University of Copenhagen and author of a number of works on medical subjects.

BANGALA, bän'gä-lä. A tribe of cannibal negroes on the Middle Congo. They are of warlike character and have furnished excellent troops to the Belgian Congo. See AFRICA.

BANGALORE, bän'gä-lör' (Hind. city of beans). A fortified town in the native state of Mysore, India, 70 miles northeast of Seringapatam, in lat. 12° 58' N. and long. 77° 38' E. (Map: India, C 6). It is the chief military station of the British in the territory, and the seat of the British resident. It has manufactures of cotton cloth and woollens, especially the latter. The place is more than 3000 feet above sea level and is remarkable for its salubrity, for the temperature seldom rises above 90° or descends below 61°. The municipal water supply is excellent, and European vegetables grow in abundance. The town is well laid out, has handsome public buildings, and beautiful botanical gardens. The most prominent structure is the Maharaja's palace. There are a number of European educational institutions, and the chief, the High School or Central College of the province, is well attended. The military cantonment, housing a large British and native force, is to the northeast. Bangalore dates from the foundation of its fort in 1537. It was a favorite residence of Hyder Ali, and in 1791 it was stormed by the British under Lord Cornwallis. Pop., 1891, 180,300; 1901, 159,000; 1911, 189,485.

BANGE, bänzh, VALÉRAND DE (1833-). A French colonel of artillery, who organized the present artillery system of the French army. He was born at Balgnicourt. In 1873, as director of the *atelier-de-précision* in the Dépôt Central in Paris, he reconstructed both the light and heavy fieldpieces then in use, and the models he proposed in 1876 were adopted for the army in 1879. From 1882 to 1889 he was director of the Cail corporation, whose plants at Grenelle, Denain, and Douai he transformed into ordnance factories. He competed successfully with Krupp in 1884 for the contract to supply the Servian government with fieldpieces. Bange's gun was also preferred by England, Italy, and Sweden. For the Antwerp Exposition of 1885 he made a gun of 34 centimeters (about 13¼ inches) calibre, 35 feet long, from which two projectiles weighing 600 kilograms (about 1320 pounds) were fired with charges of 200 kilograms (about 440 pounds) of powder, the range being 18,000 meters (about 12 miles); but the gun burst at the third discharge. Bange was the first to make effective use of the screw principle in the mechanism of the breech block, and his gas check, consisting of a pad to prevent the escape of gases in more or less modified form, finds application in most guns with screw breech block. See GUNS, NAVAL, and ORDNANCE. For a description of his inventions, consult Hennébert, *L'Artillerie Krupp et l'Artillerie de Bange* (1886).

BANGKOK' (city of wild fruit trees).

The capital of Siam and the chief commercial city of the country, situated on both banks of the Menam, about 25 miles by river from the bar at its mouth or about 14 miles direct (Map: Siam, D 4). It lies in a very low region and covers an area of over 15 square miles, principally on the left bank of the river. It is divided into many islands by arms of the Menam, and a large portion of the population live in floating houses; many houses are built on piles as a precaution against inundations, which are of common occurrence, owing to the low surface of the region. In recent years well-planned streets and roads have been built, crossing the water courses and canals and lined with many solidly built houses of brick. The portion of the city on the left bank of the river is surrounded by a high wall, about 6 miles in circumference. The part which adjoins the royal palace is beautifully laid out, with a number of parks and fine residences. The palace grounds are surrounded by a wall, inclosing the royal palace, the royal library, temples, theatre, harem, and the residences of the vast retinue of servants and attendants. The temples of Bangkok are numerous and gorgeous. A typical temple is built in several stories, rising terrace-like one above another, the whole forming a pyramidal-shaped building, the several roofs being of glazed tiles of the most brilliant colorings, while resplendent pillars are richly decorated with gold. The interior is invariably decorated profusely with precious stones, porcelain vases, and numerous statues of Buddha. In one of the temples there is a gigantic image of the saint in a reclining position, about 140 feet long, and richly inlaid with mother-of-pearl and gems. Among the temples, or *wats*, the most magnificent are Wat Phra Keo, Wat Benchamabophit (built in commemoration of the late King Chulalongkorn), Wat Phra Chetupon, Wat Suthat, and Wat Saket (in whose grounds rises the Golden Mount).

As the chief port of Siam, Bangkok has an extensive commerce, which is chiefly in the hands of Chinese and Europeans. The former have succeeded in monopolizing the retail trade as well as many of the industries of the city. The chief exports are rice and teak. In the year 1910-11 the rice export amounted to 17,588,349 piculs, valued at 91,060,879 ticals; teak, 7,624,092 ticals; total exports, 108,907,821 ticals. The native industries are almost extinct, and the porcelain ware, for which Siam was once famous, has been replaced by the Chinese article. In the year 1910-11 the tonnage entered at the port was 965,607, of which 415,393 German, 217,265 Norwegian, and 133,408 British. There is regular steam communication with Singapore, Saigon, and Hong Kong.

The transportation in the city was formerly and is still in part effected by boats, but Bangkok is now provided with a system of electric railways. A large part of the city is lighted with electricity. Bangkok is the seat of foreign legations as well as of many consular representatives, including one from the United States. There are four railway stations, terminals of the lines which connect the provinces with the capital. According to a census of 1910, the population was 628,675, of whom about 200,000 were Chinese; the remainder was made up largely of Siamese, Burmese, natives of French Indo-China, and Malays. Bangkok was an insignificant village until 1766, when Ayuthia,

the residence of the King, was destroyed by the Burmese, and Bangkok became the capital.

BAN'GLE (Hind. *bangri*, glass bracelet). A loose bracelet or armlet, generally of slender silver wire, and frequently strung with coins or ornamental pendants. Any number may be worn at one time. The bangle has a high antiquity, and many of the same form as those worn in modern times are represented on ancient works of art and have been found at Pompeii and in the tombs at Praneste.

BANGOR, ban'gôr (Gael. *Beannchar*, pointed hill). A seaport town, and favorite watering place in county Down, Ireland, on the south side of the entrance to Belfast Lough, 12 miles northeast of Belfast (Map: Ireland, F 2). It has manufactures of embroidered muslins and linen goods. Bangor Abbey, founded by St. Congall in 555, had 3000 inmates in the ninth century when it was destroyed by the Danes. The site is now occupied by the parish church. The Royal Ulster Yacht Club holds regattas at Bangor. Pop., 1901, 6046; 1911, 7776.

BANGOR (Celt. high choir). An episcopal city, municipal borough, and seaport town, in the northwest of Carnarvonshire, North Wales, Great Britain, on the southeast bank of Menai Strait, 9 miles northeast of Carnarvon, and 60 miles west of Chester (Map: Wales, B 3). The town stretches southwest through a fertile valley and is divided into upper and lower Bangor, the latter consisting chiefly of a narrow, crooked street, a mile long. The grandeur and beauty of the surrounding scenery have long made it a favorite resort. Bangor is the oldest bishopric in Wales, reputed to have been founded about 550 by St. Demiol. The cathedral built by him was destroyed by the Saxons in 1071, rebuilt in 1102, and again destroyed by fire in 1402. The present edifice, built between 1496 and 1532, is a plain embattled cruciform structure, 214 by 60 feet, with a pinnacle tower 60 feet high. There are numerous educational institutions, including the University College of North Wales, Independent, Baptist, and Normal colleges. The town has undergone much modern improvement. It was incorporated in 1883; has municipal water works, gas and electric-lighting plants, maintains a free library, and has erected artisans' dwellings. Its chief trade is derived from the great Penrhyn slate quarries, 6 miles distant, which employ over 3500 men. The slates are taken to Port Penrhyn and exported to all parts of the world. Two miles west of the city the Menai suspension bridge, and Stephenson's famous Britannia tubular bridge, one mile to the south, span the Menai Strait. Pop., 1891, 10,000; 1901, 11,269; 1911, 11,236.

BANGOR. A city, port of entry, and the county-seat of Penobscot Co., Me., 135 miles by rail northeast of Portland, at the head of navigation on the Penobscot River, on the Maine Central and Bangor and Aroostook railroads, and on the Boston and Bangor division of the Eastern Steamship Line (Map: Maine, D 4). The Kenduskeag Stream, which here empties into the Penobscot, divides the city, the sections of which are united by several bridges; and a bridge 1300 feet long, over the Penobscot, connects Bangor with the opposite city of Brewer. The city is the seat of the Bangor Theological Seminary (Congregational), founded in 1816, the University of Maine Law School, the Bangor State Insane Hospital, and the Eastern Maine General Hospital. It also has a fine county

courthouse and a custom house, high school, and public library—the three last having been erected since the \$4,000,000 conflagration in 1911. Bangor is an important commercial and manufacturing centre, with advantages of excellent water power, and a good harbor, having a deep-water frontage of three miles. Bangor is the jobbing and distributing centre for a wide area of Maine. The lumber interests are very extensive, and there are large foundries, machine shops, and factories, producing trunks, paper, stoves, canoes, and moccasins. In 1912 the value of the foreign commerce of the district of Bangor exceeded \$4,000,000. The water works and street-lighting plants are owned by the municipality. The government, under a charter of 1834, is vested in a mayor, elected annually, and a bicameral city council, which controls the appointments of most of the administrative officers, though some are nominated by the mayor, subject to the consent of the board of aldermen. A movement for commission government was defeated in March, 1913. Pop., 1900, 21,850; 1910, 24,803.

Bangor was visited by Champlain in 1604 and is one of the many places supposed to be the site of the mythical city, Norumbega (q.v.). The first permanent settlement was made in 1769 by Jacob Buswell, a "soldier and hunter, boat builder and cooper." The place was known as "Kenduskeag Plantation" until 1787, and as "Sunbury" from 1787 to 1791, when it was incorporated as a town under the name of Bangor. In 1834 it was chartered as a city. Consult: *History of Penobscot County* (Cleveland, 1882); various articles in the *Bangor Historical Magazine*, vol. i (Bangor, 1886); and an article, "Annals of Bangor," in *The Maine Historical Magazine*, vol. ix (Bangor, 1895).

BANGOR. A borough in Northampton Co., Pa., 45 miles (direct) southeast of Scranton, on the Lackawanna and Lehigh and New England railroads (Map: Pennsylvania, L 5). It is the centre of slate-quarrying interests and has silk mills and machine shops. Bangor was settled about 1760 and was first incorporated in 1875. The government is vested in a burgess, elected every three years, and a unicameral council. Pop., 1890, 2509; 1900, 4106; 1910, 5369.

BANGORIAN CONTROVERSY. See HOADLY, BENJAMIN.

BANGOR THEOLOGICAL SEMINARY. A Congregational theological school. It was chartered by the Massachusetts Legislature in 1814, opened at Hampden, Me., in 1816, and removed to Bangor, Me., in 1819, where it graduated its first class in 1820. The course of study covers three years. The relation between the seminary and the Congregational churches of the State has always been close, and to these churches the seminary has furnished more than half of their pastors. In 1913 the library contained over 28,000 volumes, and the value of the seminary property, including buildings, was over \$400,000.

BANGOT, bāng'ót. See MANGUIAN.

BANGS, ISAAC SPARROW (1831–1903). An American soldier, born at Canaan, Me. He was mustered into the Federal service in 1862 as captain in the Twentieth Maine Volunteers, participated in the battles of Antietam and Fredericksburg, was appointed lieutenant-colonel of colored troops in 1863, and was placed in command of the Eighty-first United States colored infantry. Subsequently he became colonel

of the Tenth United States colored heavy artillery, and commanded Forts Jackson, St. Philip, Pike, and Livingston, and the defenses of New Orleans. In 1865 he was brevetted brigadier-general of United States volunteers for gallant and meritorious service during the war.

BANGS, JOHN KENDRICK (1862–). A prolific American humorist and editor, born at Yonkers, N. Y. He graduated at Columbia College in 1883, where he edited the *Acta Columbiana* and first became known for his gift of humor. Later, he was associated with *Life*, *Harper's Magazine*, and *Literature*. In 1899–1902 he was editor of *Harper's Weekly*. In 1904–05 he was editor of *Puck*. He wrote *Coffee and Repartee* (1886) and *The Idiot* (1895), humorous productions which have been much enjoyed. His *House-Boat on the Styx* (1896) and *The Pursuit of the House-Boat* (1897) contain much amusing anachronism. His other works include *Mr. Bonaparte of Corsica* (1895); *The Enchanted Typewriter* (1899); *Uncle Sam, Trustee* (1902); *Proposal under Difficulties* (farce, 1905); *The Worstest Man* (play, 1905); *Lady Teazle*, a musical comedy version of *The School for Scandal* (1910); *The Idiot at Home* (1900); *The Inventions of the Idiot* (1907); *Echoes of Cheer* (1912), and *A Line o' Cheer for Each Day o' the Year* (1913), besides a large number of less known and less enduring books. Since 1910 Mr. Bangs has been very successful as a lecturer.

BANGS, LEMUEL BOLTON (1842–). An American physician, born in New York City. He graduated at the College of Physicians and Surgeons in 1872; was successively professor of genito-urinary diseases in the New York Post-Graduate Medical School and Hospital; genito-urinary surgeon in St. Mark's Hospital, New York; professor of genito-urinary surgery in the University and Bellevue Hospital Medical School. He was also consulting surgeon for various New York and Brooklyn hospitals and attending surgeon at the Bellevue Hospital. In 1895 he was President of the American Association of Genito-Urinary Surgeons. He has written an *American Text-Book of Genito-Urinary Diseases* (1898).

BANGS, NATHAN (1778–1862). An American clergyman. He was born in Connecticut. He began to preach as an itinerant in 1801, labored for some years in Canada, and removed to New York in 1810. He was chosen head of the Methodist Book Concern in 1820, and in 1828 became editor of the *Christian Advocate and Journal*. In 1829 he was elected Bishop of Canada, but declined the office. He became president of the Wesleyan University in 1841, but soon afterward returned to pastoral work in New York. Dr. Bangs was the author of numerous publications, the most important of which is the *History of the Methodist Episcopal Church* (4 vols., 1839–41). Consult a *Life* by Abel Stevens (New York, 1863).

BANGUED, bāng-gān'. The capital of the province of Abra, Luzon, in the Philippines (Map: Philippine Islands, C 2). The province is situated in the northern part of the island, has an area of 1484 square miles, and a population of 49,702. The surface is rugged, and there are numerous volcanic spurs. The valleys are fertile, with cotton, tobacco, rice, vegetables, etc., as the principal products. The capital is situated on the left bank of the Abra River, 236 miles north of Manila. It was first

settled in 1598. It has a telegraph station. Pop., 1903, 12,956.

BANGWEOLO, bāng-wé-ō'lo. A shallow lake of central Africa, situated in Northern Rhodesia, between lat. 11°-13° S., the meridian of 30° E. cutting it centrally (Map: Africa, G 6). Its area is about 1158 square miles, and it is 3675 feet above the sea. It lies in the midst of a flat plain, its shores are low, parts of the lake are merely swampy in the dry season, and its surface is considerably expanded in the months of rain so that the shore line cannot be definitely defined. Most of the open water is bordered by tall water reeds. In the lake are a number of small inhabited islets, the largest of which is named Kisi. The chief tributary of the lake is the Chambezi from the east, while its outlet is the Luapula, issuing from its southern end, the large eastern source stream of the Congo. The lake was discovered in 1868 by Livingstone, who died at Chitambo's, on May 1, 1873, on the south shore of the lake. He believed that Bangweolo was one of the sources of the Nile. Consult Singer, "Der Bangweolo-See," in vol. xlii, *Petermanns Mittheilungen* (Gotha, 1898), and Weatherley, "Circumnavigation of Lake Bangweolo," in *Geographical Journal*, vol. xii (London, 1898).

BANIALUKA. See BANJALUKA.

BANIAN, bān'yan (Skt. *vani*), merchant, trader). In India, a merchant or trader generally. It is more particularly applied to the great merchants in the west of India, especially in the seaport towns of Bombay, Surat, Cambay, etc., who carry on a very extensive trade by means of caravans with the interior of Asia, even to the borders of Russia and China. These merchants travel much, and the establishments and countinghouses of Indian banians are to be found in almost every commercial town of any note in Asia. In Bengal a corrupted form *bunya* is often applied to the native grain dealer. Some of the Marathi banians are agriculturists as well as traders, while in the Punjab the banians are said to belong in part to the degraded Chamar, or leather-working caste. Broadly speaking, the banians are a subdivision of the Vaisya caste, although in Bengal they are ranked with Sudras. In religion they are predominantly Vishnuites, with a large number of Jains in the west of India. From its original association with the merchants and the market place, the banyan tree of India received its name.

BANIAN. See BANYAN.

BA'NIM, JOHN (1798-1842). An Irish novelist. He was born at Kilkenny, April 3, 1798. In 1822 John and his older brother Michael (1796-1874) planned a series of short novels, which should do for Ireland what Scott was doing for Scotland. Three years later appeared *The O'Hara Tales*, followed in 1826 by a second collection; in 1828, by a third series, this last by Michael alone, as also another series in 1839, to which Miss H. L. Martin contributed "Canvassing." These sketches at once attracted notice, and they have maintained a place in literature. They contain many vivid portrayals of character, with the emphasis laid on the dark side of Irish life. If they have not the humor of Maria Edgeworth's *Castle Rackrent*, there is a certain compensation in the poetic feeling of John and in the vigor of Michael. See, for example, *Father Connell* (1840), by the latter. John afterward published several longer novels,

The Boyne Water (1826), *The Anglo-Irish* (1828), and *The Denounced* (1829), besides several dramas, the best known of which is *Damon and Pythias*. In 1836, general sympathy having been attracted towards his privations, occasioned by disease that prevented all literary exertion, a pension of £150 per annum from the Civil List was awarded him, which was afterward increased by £40 for the education of his daughter. He died at Windgap Cottage, near Kilkenny, Aug. 13, 1842. Michael lived on, and wrote *The Ghost Hunter* (1833), *Father Connell* (1840), *Clough Fion* (1852), and *Town of the Cascades* (1864). He died at Booters-town, near Dublin. Consult: Murray, *Life of John Banim* (London, 1857); H. S. Krans, *Irish Life in Irish Fiction* (New York, 1903); and see the section relating to Irish literature in Keating's *History of Ireland*, ed. by D. Comyn (1902-1908). See also IRISH LITERATURE.

BANISHMENT (for derivation, see BAN). An extreme form of punishment for crime in primitive society, consisting in the exclusion of the criminal from the protection of the law and his abandonment to his enemies and to strangers. The ban or sentence of outlawry (q.v.) passed upon him not only absolved his family or tribe from all responsibility for him, but also involved the confiscation of his lands and goods. It was usually incurred for a refusal to submit to the jurisdiction of the tribunals or to the ordinary penalties imposed by them. In more advanced society banishment has sometimes been practiced as a punishment for crime—usually as a commutation for the death penalty—but in a mitigated form not involving outlawry, but enforced absence from the country. In this form, either with or without confiscation of goods, it was not an uncommon form of punishment in the Middle Ages, and in England during the Wars of the Roses; and it is to-day employed in some countries—as in Russia, Turkey, and the Central and South American republics—as a punishment for political offenses. In later English law the term has been employed to describe the penalty of transportation to the colonies, instituted by the act of Parliament, 39 Eliz. c. 4. Banishment has never been practiced as a means of punishment in the United States. It would probably fall within the constitutional provision forbidding the imposition of cruel and unusual forms of punishment. The practice of excluding or of deporting undesirable aliens, which obtains in America as well as in most other civilized countries, does not come under the description of banishment. See EXILE; PUNISHMENT; ALIEN; DEPORTATION.

BANISTER. See BALUSTER.

BANJALUKA, bān'yá-lōw'ká, or **BANIA-LUKA**. A town of Bosnia, the capital of the district of the same name, situated on the navigable river Verbas and connected by railway with Agram (Map: Austria, E 4). It contains a number of mosques and several monasteries, and in its vicinity are situated some hot springs and coal and iron mines. It has cloth, powder, and grain mills, manufactures tobacco and beer, and carries on a trade in grain, animals, and tobacco. Pop., 1910, 14,793, including about 7000 Mohammedans, 2000 Catholics, and over 300 Jews. Banjaluka was, in 1878, the scene of an engagement between the Austro-Hungarians and the Bosniaks.

BANJERMASIN, bān'jēr-mās'sin. A city and district in Southeastern Borneo, held by the

Dutch since 1787 and incorporated in their possessions since 1860. The region is watered by the Banjar River, is inhabited chiefly by Dyaks, and produces gold, diamonds, coal, spices, gum, iron, wax, rattan, etc., in which articles there is considerable trade. Forest and jungle in the hilly interior, and rice fields in the flat valleys and along the seacoast are the features of the landscape. The town of Banjarmasin is built mostly on piles because of frequent inundation. Pop., 1895, 45,082; 1900, 52,685.

BAN'JO (a corruption, in negro-slave pronunciation, of *banjore*, *banjer*; cf. *bandore*, Portug. *bandurra*, Russ. *bandura*, all from Gk. *παλδούρα*, *paldoura*, a musical instrument with three strings). An instrument of the guitar kind, with or without frets, played with the fingers. It has a long neck, with a body resembling a tambourine or drumhead, formed of parchment stretched tightly upon a hoop. Banjos have from five to nine strings, usually of catgut, the lowest in pitch, however, being often covered with wire. The melody string, or thumb string, is placed outside the lowest bass string, and is played by the thumb of the right hand; the turning peg for it is inserted halfway up the neck. The thumb string from nut to bridge measures 16 inches, the other strings 24. The five-stringed banjo is tuned either *a*, *e*, *g*#, *b*, *e*, the last note being the thumb-string, or in *G*, a note lower. The pitch of the banjo is an octave lower than the notation. The banjo is a favorite instrument with the negro. Thomas Jefferson (*Notes on Virginia*, page 47) speaks of it as an instrument "proper to the blacks, which they brought hither from Africa, and which is the original of the guitar, the chords being precisely the four lower chords of the guitar." In Africa the instrument is known under the name *bania*.

BANJUMAS. See **BANYUMAS**.

BANJUWANGY, *bân'joo-wân'gēs* (fragrant water). A seaport on the east coast of Java, the chief town of the district of that name (Map: East Indies, D 6). It is a military station, has extensive trade, and has an estimated population of 9000.

BANK (same as *banc*, bench, elevation). A portion of the oceanic basin within which the water is relatively shallow. A bank covers a larger area than a bar, the banks of Newfoundland and of the British Isles extending over several thousands of square miles; the depth of water also may be such as to offer no obstacles to navigation, although considerably less than the average for the oceanic trough. Banks occur off the shores of continents and islands where they have been built up by the deposition of sediment swept along by currents whose velocity (and hence transporting power) has been checked by contact with an opposing current or with a body of still water. In the case of the Newfoundland banks much of the sediment is transported by the icebergs brought down by the Arctic current from Greenland; that current meets the warmer waters of the North Atlantic drift south of Newfoundland and the bergs are then rapidly dissipated. Submarine banks have an important economic interest in that they afford the best fishing grounds for cod, mackerel, herring, and most of our edible sea fishes.

BANKA. See **BANCA**.

BANKBAN, *bânk' bân'* (properly **BENEDICT BOR**), called also **BANBANUS**. A Hun-

garian military governor of the thirteenth century. There is a story, almost certainly legendary, to the effect that, his wife having been wronged by the Queen's brother, he stormed the royal castle and cut the Queen to pieces. On this are founded two dramas—one in Hungarian by Katona (1827), and the other Grillparzer's *Ein treuer Diener seines Herrn* (1830)—as well as a national opera by Friedrich Erkel.

BANK, BANK'ING (Fr. *banque*, It. *banca*, from Ger. *Bank*, a bench, table for changing money. Hence, *bankrupt*; It. *banca*, *rotta*, broken bench, as in Florence a bankrupt had his bench broken). The three functions which characterize the banking business are the receipt of deposits, the making of discounts, and the issue of notes. The last named is generally restricted in modern times to institutions chartered by law, though in earlier days, and especially in England, private banks and banking firms issued notes. But as all banks do not embrace all these functions, it is common to speak of banks of deposits and discount, as distinguished from banks of issue. The latter are, as a rule, banks of deposit and discount also; and, as this is the most universal function of banks, it may properly be considered first.

Banks may be tersely described as lenders and borrowers. Their loanable funds consist on the one hand of their own capital, and on the other of the deposits intrusted to them. Their profits arise from the payment to them of interest on loans.

Banks as Borrowers. Receiving as they do deposits from their clients, banks may be spoken of as borrowers. If, as they sometimes do, they pay interest upon deposits, this offsets in part the profits arising from loans. But in many cases they pay no interest upon deposits, the clients of the bank being contented with the greater security in the custody of their funds which the bank offers, and other advantages which arise from the possession of bank accounts. At times these advantages have been so considerable that depositors have been willing to pay the bank for the safe-keeping of their funds. Thus, during the seventeenth century, the great Bank of Amsterdam simply received bullion and stored it, issuing receipts for it, which could be transferred from hand to hand, and entitled the holder to get back the gold or silver originally deposited on the payment of a small premium for withdrawal. Such a bank was merely a warehouse for bullion. It performed a service similar to that of the United States Treasury in the issue of gold and silver certificates. The service was valuable because it substituted the notes of the bank for the extremely varied and uncertain metallic circulation of the period, consisting of the coins of many nations, often worn by use, and clipped by those who derived profit from mutilating the coinage. The bank received them at their bullion value, and thus fixing their real value once and for all, did away with the numberless vexations which arose from the use of such a currency. If we except the United States Treasury, which cannot strictly be called a bank, such banks of deposit only have ceased to exist. The reason for them has disappeared, and the lending of money is always associated in banking with the receiving of it.

Modern banks are banks of "deposit and discount," for though all loans made by banks are not in the form of discounts, the word is used in this connection to embrace all its loans. The

advantage to society from banking operations consists in centralizing credits. Through the agency of the banker, wealth which would lie idle and unproductive becomes useful and productive. His particular service is to mass together the small amounts of capital which in themselves are perhaps too trifling to become the basis of a business enterprise. He is the intermediary between those who possess capital and those who employ it. Thus he enlarges the field of business enterprise and intensifies its operations. The bank is the chief organ of credit which plays so large a rôle in the organization of modern industrial society. See CREDIT.

For the depositor the bank acts as paymaster. The depositor pays his debts by orders upon the bank in the form of checks. This not only relieves the depositor of the necessity of keeping in his own possession sums of money larger than he has an immediate use for, whose safe-keeping would be a matter of anxiety and concern, but also furnishes him, through the indorsement of the check by payee, a receipt for the money paid out. The banks also act as collectors for their depositors. Only a small part of the deposits in banks consists of actual cash; by far the larger proportion, often nine-tenths, being in checks and other credit instruments. When a check is deposited to the credit of a person, the bank charges itself with the duty of collecting it. If it is drawn upon a distant point, a small charge is made for this service, but in general the cost is borne by the bank and not the depositor. If drawn upon the same bank, the collection consists merely of a transfer upon the books of the bank. If drawn upon another bank, collection may be made directly or through the clearing house. (See CLEARING HOUSE.) In either case there is likely to be a set-off, and the collection effected without the transfer of cash. But in addition to collecting checks, the bank collects other debts, such as coupons and negotiable paper.

In addition to these advantages which the depositor obtains from his bank account, he sometimes receives interest upon his deposits. Among the commercial banks of the United States the practice of paying interest upon deposits is not widespread. Persons who desire interest upon deposits must, as a rule, be content to surrender something of the absolute and immediate control over their funds, which is the characteristic of commercial banking. In such cases they patronize the savings banks or the loan and trust companies rather than the national banks. In these institutions various plans are adopted to restrain the depositor from making sudden calls for any considerable amount of his deposit. Sometimes it is a requirement of previous notice of the intention to withdraw, or again it may be a provision that a certain part of the deposit is to remain untouched, and that interest be paid upon this only.

The function of the commercial bank is in the main to collect sums that are temporarily idle and to make short-time loans. For permanent investment and for long-time loans other financial agencies are requisite. It is true that commercial banks may invest a part of their funds in long-time loans. This is usually done for the purpose of using temporarily sums not currently needed in ordinary banking operations. Sometimes a bank keeps large volumes of such bonds as a secondary reserve—wealth that can easily be changed into cash in time of need.

In recent years, however, national banks in the United States have entered into competition with trust companies and other similar institutions in the pure investment field. The national bank holdings of bonds, other than those of the Federal government, amounted to over a billion dollars in 1912 and 1913.

Banks as Lenders. From the services which the bank renders those from whom it borrows, we may turn briefly to the more obvious services rendered to those to whom it loans. Bank loans are, in form, time loans for a definite period of days or months, and call loans, upon which instant payment may be demanded at will. Either form of loan may be made on the personal credit of the borrower, though this is not considered good banking, and can be safely done only in cases of persons of unexceptionable standing. Loans are made, as a rule, upon mercantile paper and upon personal notes secured by the deposit of collateral. The time of the loan is definitely fixed by the face of the instrument, and the amount loaned is that stated in the note or draft, less the interest upon the same for the unexpired time. Loans upon collateral are either for a definite period of time or on call. As in the latter case the amount of interest cannot be fixed in advance, it is customary to loan a definite sum, and at the expiration of the loan collect also the interest at a rate agreed upon for the duration of the loan. The collateral or security consists of stocks or bonds greater in value than the amount of the loan and probable interest, which are for the time being deposited with the bank. In the event of failure to pay the loan the bank secures the satisfaction of its claim by the sale of the securities. In the case of discounts of mercantile paper the bank relies upon the good faith and general property of the several parties to the note or draft, without having a claim against any specific property. Ordinarily the borrower is content to receive the loan in the form of a credit account upon the books of a bank, upon which he may draw checks at will. Thus the discounted value of the mercantile paper or personal note is credited to the borrower as a deposit. In most modern banks of deposit the vast mass of the deposits are created in this way. In effect the borrower has merely exchanged his credit for that of the bank. He is ready to pay current interest to the bank because the latter's credit is generally acceptable and serves all the purposes of ready money.

It is clear that in so far as a bank makes its loans from its capital, it can use for that purpose all that is not needed for running expenses. It should be remarked that commercial banks must have a considerable capital of their own, not only for running expenses, but also as a guaranty to depositors. The larger the capital of the bank, the greater the feeling of security among the depositors that, the personal property of the bankers being embarked in the enterprise, caution and prudence will guide its steps, and that in the event of bad investments the bank will yet be able to meet its obligations as trustee of their funds. But if a bank can employ all its capital, it cannot employ all sums deposited with it in making loans, because occasions are always occurring for removing deposits as well as making them. Business men, for example, day by day, deposit with their bankers the checks or sums of money which they receive in the course of their business; and, on the other hand, day

by day, draw out such sums as they require for the payment of purchases of goods, wages, rent, and other expenditure. A bank, therefore, while continually receiving deposits, is continually repaying deposits; and the amount uncalled for is subject to a daily fluctuation. At one period of the year, or in a certain condition of trade, the amount of deposits may be high; at another, low. As it is a principle at the very root of banking that deposit liabilities shall be met, either on demand, or punctually at the expiration of a stipulated notice, it follows that banks must always have at hand sufficient funds to meet any emergency. When business is in its ordinary condition, a bank can, after some experience, approximate pretty nearly to the amount of the greatest demand for a return of deposits throughout the year, and provide accordingly. But sometimes the credit of a bank becomes doubted, either from causes peculiar to itself, or on occasions of a panic or general distrust, when all who own money wish to have it in their own possession. In these cases there is a *run* on the bank for repayment of its deposits, and the amount called for may be far beyond the maximum demanded in ordinary times. If the bank has not retained a sufficient amount of cash to meet the demand, it is said to *suspend payment*, and, as a general rule, it must wind up its business, the confidence of the public that it will in future meet its liabilities on demand being now destroyed. There are two prime rules in safe banking: the one is, that the bank shall lend its funds only on undoubted and readily realizable securities, however low the profit; and the other that the bank shall retain a sufficient amount of its resources—and this is called the *reserve*—to meet the possible demands of the depositors even in case of a *run*, although there may be no reason to expect one; for when a run comes, it seldom casts its shadow before. But it is evident that the greater the reserve of a bank, the less the amount of funds which it can lend out and draw interest for; hence the temptation which banks lie under of imprudently lending out a too great proportion of their funds; and it is their yielding to this temptation that almost always precipitates the failures of banks.

In the practice of private banking the amount of the reserve is wholly in the discretion of the banker. Chartered banks are frequently subject to legal provisions which determine not only a minimum reserve, but prescribe how it shall be held. Thus under the National Banking Act of Dec. 23, 1913, banks in "central reserve cities" (New York, Chicago, and St. Louis) must hold reserves equal to 18 per cent of demand deposits and 5 per cent of time deposits; a bank in a reserve city must hold reserves of 15 and 5 per cent respectively; other banks, 12 and 5 per cent.

In England the practice of banks is somewhat similar. The reserve of the banking department of the Bank of England is always in coin or in notes against which there is coin lying in the issue department of the bank. Other banks generally hold a portion of their reserve as a deposit in the Bank of England. As the Bank of England is the channel through which, directly or indirectly, payments are made and moneys received, by other banks, it is more convenient for them to have their reserve lying as a deposit in it than lying as gold within their own vaults. In the case of a demand on their

reserve, the banks will draw out their deposits, in notes, or, if gold be in demand, in gold, from the Bank of England. Whether, therefore, the reserve is deposited in the Bank of England, or is in Bank of England notes, it is from the coin in that bank that the gold comes in the case of a run. It is apparent from this that it is essential to the stability of all banks in that country, so long as they themselves do not keep a sufficient reserve of coin in their coffers, that the Bank of England shall always be possessed of coin, and ever be able, on demand, to pay its depositors in gold, or to give gold in exchange for all its notes that may be presented to it.

Banks of Issue. The profit of a bank arises from the interest upon its loans—from its discounts. The fact that the borrower is usually willing to leave the funds borrowed with the bank as a deposit subject to check enables the bank to make a far greater volume of loans than it could otherwise do, and hence increases its profits. Where banking is not highly developed, however, the check is not a satisfactory means of making payment. In country districts sellers of produce often hesitate to accept checks, doubting the credit of the drawer. Under such conditions a bank, if not restrained by law from so doing, may employ its credit in the form of bank notes. Such notes are merely the promises of a bank to pay a certain sum on demand; they are liabilities essentially of the same nature as deposits. Sound banking requires that a reserve shall be held for their redemption on demand, exactly as a reserve is held against deposits. There is no general rule as to the proportion of reserve to deposits in either case; but the proportion will generally be the same. It follows that there is no basis in fact for the popular view that banks which issue notes secure extraordinary profits thereby. The profit which a bank gains through making a loan of its credit in the form of bank notes is exactly the same as the profit it gains through lending its credit in the form of a deposit. It is of course a matter of great importance to the business man that he should be enabled to secure bank credit in a form which meets the needs of the community. In a great city the most convenient form is the deposit upon which checks may be drawn; in rural districts the most convenient form is the bank note.

Where banks are freely permitted to issue notes, the process of redemption is analogous to the process by which checks are presented for cash. Every day business men deposit with their banks notes received in payment for goods, etc. If such notes are deposited with the bank which issued them, the form of liability of the bank is simply changed, the value of the note being credited as a deposit. If deposited with other banks, they are assorted and presented promptly to the issuing bank through a clearing house, to be redeemed in cash. Accordingly no bank can issue an indefinite volume of notes, since this would endanger its solvency. There are the same restraints upon overissue of notes as upon overexpansion of deposits.

Although the bank note and the deposit are essentially liabilities of the same nature, the former is in most countries subjected to far more stringent regulation than the latter. The discrimination made by government in its treatment of the two forms of liabilities is explainable partly by the fact that whereas the deposi-

tor is presumably familiar with the financial standing of the bank in which he keeps his funds, no one can be expected to be a fair judge of the solvency of all banks whose notes he may receive in the course of business. In some measure the discrimination is due to the fact that the similarity in appearance between the bank note and lawful money creates a general belief that note issue is more properly a governmental function than any other use of the bank's credit, and should therefore be subjected to minute regulation, if not actually assumed by the government.

Where the regulation of note issue is very stringent, it often happens that banks are deterred from employing notes in making loans. If the check system is not commonly employed, the result is a reduction in the lending power of the banks, since every loan implies the withdrawal of money. The principal sufferers, under these conditions, are the borrowers, who are compelled to pay a higher rate of interest than would be necessary if the banks could employ their credit more fully.

Governmental regulation may take the form of making the noteholder a preferred creditor in case of insolvency of the bank. This provision may be reinforced by giving the noteholder also a limited claim upon the general property of the stockholder. Thus, if the total assets of an insolvent bank are insufficient to redeem its notes, the stockholder may be called upon to make up the deficit, to the extent, say, of the par value of stock held by him. Further, note issue may be limited to a certain proportion of the capital of a bank. The various banks enjoying the privilege of note issue may be compelled to contribute to a fund for the redemption of notes of banks which have failed. Another method is to require the pledge of specified securities as a guaranty to the noteholder. This plan is best exemplified in the national banking system of the United States before its revision by law of 1913.

From a social point of view the bank is to be regarded not merely as a means of bringing together borrowers and lenders. It plays also an important part in supplementing the currency of a country, both through the issue of notes and through the creation of deposits. Were it not for bank notes and checks, the amount of coin needed in a country like the United States to effect exchanges at existing prices would be several times greater than it is at present. Moreover circulation consisting of lawful money alone is ill adapted for the needs of modern business. A volume of money that would be adequate at certain seasons of the year will be inadequate at other seasons. Hence the need of an elastic element in the currency such as bank notes and deposits afford. When business is active, mercantile paper in large quantities is brought to the banks for discount, and the volume of deposit currency expands automatically; when business is dull, notes are paid off and the volume of currency shrinks. Where bank-note issue is free, the volume of notes expands and contracts automatically in response to the demand for currency. A serious defect in the national banking system of the United States, as it existed prior to the Currency Law of 1913, was the rigidity of its note circulation. The banker who wished to increase his circulation, through the bond deposit requirement described below, was compelled to suffer delays which often

prevented him from securing the additional notes until all need for them had passed. In some countries, as Germany, this difficulty is met by permitting the banks to issue above their permitted limit, subject to a heavy tax which obviates the danger of permanent overissue.

Banking in the United States. The earliest use of the term "bank" in the American Colonies was to designate an issue of paper money, and it may be said that, in the history of banking in the United States, banks of issue play a more important part than elsewhere. All the banks mentioned in Colonial history were loan banks, and not deposit banks. The funds they loaned were issues of notes. Between the issues thus loaned by banks under authority of the government, and the issues of the Colonial governments, no clear distinction was drawn, and all such issues were frequently designated as banks. (See MONEY.) This is not to be wondered at when we recall the fact that the issues of the Colonial governments, notably in Pennsylvania, were loaned to individuals, on mortgages, plate, and other securities. The collapse of the continental paper currency in 1781 led to the chartering by Congress on the last day of the year of the Bank of North America. In addition to the usual business of a bank, this institution was designed to furnish through its notes a circulating medium for the country. The Bank of New York, and that of Massachusetts, at Boston, were chartered in the year 1784. But the erection of these institutions did not check the issue of paper money by the several States, which, however, ceased with the adoption of the Federal Constitution, which expressly forbade such issues.

Among the earliest acts of the new Congress was one chartering the first Bank of the United States, Feb. 25, 1791. The charter was for 20 years. The authorized capital was \$10,000,000, of which the government took \$2,000,000. The capital subscribed by the public was to be paid one-fourth in specie and three-fourths in government securities bearing 6 per cent interest. The government subscription was to be borrowed from the bank, payable in 10 annual instalments. The notes issued by the bank were receivable by the government for all debts due to it. The charter of this bank did not prevent the rise of a considerable number of banks in the States, which also issued notes. But by reason of its larger capital, and its several branches in different parts of the country, the Bank of the United States dominated the entire banking system and regulated the issues of the State banks. It could and did refuse to receive as deposits, or in payments, the notes of banks which were not sound, and by sending the notes received from one branch to another would insure the presentation of the notes of other banks for redemption. In the early part of the century the government sold its stock in the bank, and when, in 1811, the charter expired, the government had no direct interest in its renewal. The renewal of the charter was opposed by the State banks, and the effort to secure it failed. The bank, thereupon, wound up its affairs. The absence of the restraining influence of the Bank of the United States soon made itself felt. State banks multiplied; from 90 in 1810, they grew to 150 in 1814, with note issues of \$62,000,000. The war with England brought about a general suspension of specie payments, and a very disordered

state of the bank-note circulation, the only currency of the country. The "old regulator" was seriously missed, and, on April 3, 1816, Congress chartered the second United States Bank at Philadelphia, with power to establish branches. Its capital was \$35,000,000, of which the Federal government took \$7,000,000; the bank, with its branches, was made the official depository of government money; its bills were receivable for all payments to the government and it was the agent for negotiating Federal and State loans. This compelled the State banks to resume specie payments, and business again moved forward steadily. State banks, however, grew in number rapidly. In 1816 there were 246, with \$90,000,000 capital. In 1830, when the rechartering of the United States Bank was proposed, there were 330 State banks, with \$145,000,000 capital. President Jackson, in his message, December, 1829, expressed his opposition to the United States Bank, and his expected veto of the bill to renew the charter came in July, 1832. The next step was to remove the deposits of public money from the bank. This took the form of an order to cease deposits in the United States Bank and to draw out the balance in payments. This could be done only by order of the Secretary of the Treasury, and as that officer refused to conform to the President's wishes, he was summarily removed, and a more tractable man was appointed in his place. The old bank, which had more than once saved the credit of the nation, was crippled and went down. In the wind-up it was found that its whole capital was lost, though it managed to pay its debts. It continued operations under a charter from the State of Pennsylvania until 1837, when it failed in the general crisis.

The refusal to continue the National Bank gave full scope to State institutions, and they grew with mushroom rapidity. In 1837 there were 788 of them, with a capital of \$291,000,000. Their aggregate circulation was \$159,000,000 and their deposits were \$127,000,000. The loans and discounts amounted to \$525,000,000. The inevitable crash was hastened by an enormous crop of cotton in 1836, a consequent decline in prices, and the depreciation of the credit of cotton dealers and their backers. The tumble began in 1837, and by the first of June there was an entire suspension of specie payments; values of all forms of property depreciated, business was deranged, and a period of wretchedness began which continued nearly five years. However, Congress passed a general bankruptcy law, the States assisted, by limitation and other laws, and by 1843-44 the country had nearly recovered. The banks had many trials; some resumed only to suspend again, and many went into liquidation. Congress passed the Independent Treasury Act, and thereafter the Federal government had no direct concern in banking until the Civil War broke out. The crisis of 1837 taught wisdom to the State banks, and a general retrenchment was the consequence. Between 1838 and 1842 the number of banks was reduced from 829 to 691; capital from \$317,000,000 to \$229,000,000; circulation from \$116,000,000 to \$59,000,000; and discounts from \$486,000,000 to \$254,000,000. Further security was demanded by the public, and among the new measures were the Suffolk Bank plan in Massachusetts, and the New York safety-fund system. The Suffolk Bank plan was merely an arrangement whereby that bank was made the channel

through which all notes of New England banks that found their way to Boston, as most of them naturally did, were at once forwarded to the issuers for redemption. The result was that all solid bankers found it for their interest to deposit with the Suffolk a redemption fund, as that insured the acceptance of their notes.

The New York safety-fund system required each bank to deposit, with the banking department of the State, securities consisting of Federal or State stocks, or bonds and mortgages, which, in case of the failure of the bank, were sold, and the proceeds applied to the liquidation of its debts. In 1857 there was another crash, followed by a general suspension of specie payments; but the depression did not long continue.

One of the serious evils, avoided to a great extent by the issue of greenbacks and national bank currency, was counterfeited or altered bills. When almost every bank had its own plates for six or more denominations of notes, the country was flooded with counterfeits and alterations, and no business man ventured to accept a bank note not well known to him without previous comparison with counterfeit detectors, weekly volumes giving description of counterfeits and spurious notes. In 1862 there were counterfeits on the notes of 253 banks, besides 1861 bills imitated, and 1865 entirely spurious notes. On the best notes there was a discount in the business centres of from 1 to 10 or even 15 per cent; and exchange was more variable than the weather. The "wild-cat" and "red-dog" banks of Michigan and other Western States were notoriously unsafe. A dozen of them would club together to make a show for one only, when the examiner came along, and the same specie would be an hour in advance of him all along his route. The "red-dog" bank was so called because of its movable nature and of the color stamped on its notes. Established in one place on Monday, the "banker" might pack his carpet-bag at night, and on Tuesday open his bank 50 miles away; in which case he stamped in red ink on the face of his notes the name of the place in which the "banking-house" was last established.

The Civil War (1861-65) made large issues of credit necessary, and among the earliest financial proposals was one to enlist the interest of banks in the national credit by permitting them to organize under a national law and issue notes on the basis of bonds purchased by them and deposited with an officer of the government. It was, however, some time before these proposals took the form of law in February, 1863. The principle upon which this act was based was the issue of notes based upon government bonds deposited with the Treasury. The law proved defective, and was replaced by the Act of June 3, 1864. Under this act there was established a bureau in the Treasury Department, presided over by the Comptroller of the Currency, which should have supervision over the national banking system. No bank with less than \$100,000 capital was to be organized in cities of above 6000 inhabitants; for places under 6000, the organization of banks with a capital of \$50,000 was permitted. Fifty per cent of the capital of a bank was required to be paid in before the bank could commence business; the remainder of the capital was to be paid in in five equal monthly instalments. At least 30 per cent of

the paid-in capital was to be invested in United States bonds, and transferred to the Treasurer, upon which he was authorized to issue to the banks notes equal to 90 per cent of the par value, but not to exceed the market value of bonds so deposited. The entire amount of currency to be issued was limited to \$300,000,000, one-half to be apportioned among the States according to their representative population, and the other half with regard to the existing banking capital, resources, and business of the several States. The notes were to be redeemable in lawful money on demand, and were receivable in all payments to the United States, except for duties on imports. Country banks were required to maintain reserves equal to 15 per cent of their outstanding notes and deposits, of which three-fifths might be redeposited with other national banks in 17 specified large cities, denominated reserve cities. Reserve city banks were to maintain reserves equal to 25 per cent of their deposits and outstanding notes, but one-half of such reserves might be redeposited in national banks in New York City, which was made a central-reserve city. Later Chicago and St. Louis were placed on the same footing. Country banks were obliged to provide for redemption of their notes at par by some reserve city bank; reserve city banks were required to make similar provision for redemption in New York City. The system was slow in getting into operation, and the aid rendered the government by furnishing a market for its bonds was, after all, slight. In January, 1865, there were only 638 banks that had organized under the national law. To hasten the process a law of March 3, 1865, imposed a tax of 10 per cent on the notes of State banks, to go into effect July 1, 1866. Under the stimulus of this law the reorganization proceeded rapidly, and in October, 1866, the number of national banks had reached 1644. The subsequent development of the national banking system is briefly shown in the following exhibit, dealing with the years 1870 to 1913:

DATE	Number of banks	MILLION DOLLARS				
		Capital, surplus, and undivided profits	Individual deposits	Circulation	Loans and discounts	U. S. Bonds to secure circulation

National Banks. Of the national banking system, it may be said that the Civil War presented to Congress as its first duty the invention of some plan for repressing the heterogeneous banking system and providing a system of a homogeneous and absolutely safe character—one that would be truly national, operating alike in every part of the United States. The neces-

sities of the government inspired the new order, but the old was rapidly failing to meet the wants of the people. The new, therefore, may be said to have grown out of the necessities of business as well as the straits of the nation. The new system preserved all the advantages of the old and added many new ones. It gave absolute protection to the holders of the national bank notes, as government bonds were deposited with the United States Treasurer in 10 per cent excess of their issue for the security of their redemption. It provided a high degree of security for the deposits, making the stockholder liable, in an equal amount of his stock interest, for their ultimate payment. It provided for a uniform bank note of equal value in every part of the country, so engraved and issued that security against counterfeits was far better attained than ever before. It provided for a system of redemption which made exchange merely nominal, and gave to national bank notes, wherever issued, a uniform value throughout the country. It provided a system of published reports over the sworn signatures of the executive officers of the banks, and a uniform system of examination under the direction of the Comptroller of the Currency.

The national banks were required to pay to the revenues of the general government as follows: (1) one-half of 1 per cent, semi-annually, on the circulation allowed by law; (2) one-quarter of 1 per cent semi-annually, on the average deposits for the half year; (3) one-quarter of 1 per cent semi-annually, on capital not in government bonds. The act permitted local taxation of individual holdings of national bank shares, but not at a higher rate than that applied to other moneyed capital.

Without any wide departure, until 1913, from the principles laid down in the original act, the laws governing national banks were, from time to time, considerably modified in details. Thus the restriction upon the aggregate amount of bank-note issues was removed in 1875. The charters of the banks were to lapse in 20 years, but in 1882 Congress authorized the recharter of the banks for terms of equal length. The currency law of March 14, 1900, made a number of important changes in the conditions of the issue of national bank notes. It permitted the issue of notes to the par value of the bonds deposited, instead of 90 per cent of the par value, subject only to the restriction that, in case the market value of the bonds should fall below the par value of the same, additional deposits of bonds or of lawful money might be required to maintain the security for the notes issued. The law provided for the conversion of several series of outstanding bonds into 2 per cent gold bonds, payable 30 years after date. To effect this change it offered to the banks a special inducement in reducing the tax upon the circulation, so far as issued upon the new bonds, from 1 per cent to one-half of 1 per cent. The act, moreover, favored the extension of the national banking system to small communities, inasmuch as it permitted the erection of banks with a capital of \$25,000 in places where the population was less than 3000. The object of these changes was to extend the system and render the issue of notes more attractive. That this was accomplished is indicated by the fact that the total outstanding circulation of national banks increased from \$254,026,230 on March 13, 1900, to \$770,136,000 on June 4, 1913.

**ABSTRACT OF REPORTS OF EARNINGS AND DIVIDENDS OF NATIONAL BANKS IN THE UNITED STATES FOR THE
YEAR ENDED SEPTEMBER 4, 1912**

Banking Reform. As a result of the currency disturbances of 1907-08 (see CRISIS), Congress enacted in 1908 a law, popularly known as the Aldrich Act, providing for an emergency circulation, not to exceed \$500,000,000, and taxed at a rate of 5 per cent for the first month and 1 per cent for each additional month up to a maximum of 10 per cent. Such circulation might be based (1) upon approved State, county, or municipal bonds deposited with the Treasurer at Washington, on which notes might be issued up to 90 per cent of par value; (2) upon approved securities or upon two-name commercial paper, secured by the credit of associations of not less than 10 banks, organized for this purpose under the authority of the Comptroller of the Currency, such issues not to exceed 30 per cent of the capital and surplus of the issuing bank. No issue of circulation was ever made under this act, the provisions of which were obviously so onerous that only an extreme state of crisis would justify the banks in availing themselves of the privilege of emergency issue.

In 1910 a commission, under the chairmanship of Senator Nelson A. Aldrich, was appointed by the Senate to investigate the whole question of banking reform. This commission (popularly

known as the National Monetary Commission) appointed numerous experts to examine banking conditions at home and abroad, and after three years of work filed its report. In the meantime Senator Aldrich proposed, in 1911, a plan for banking reorganization, the central feature of which was a National Reserve Association, to found what was essentially a central bank, the stock in which was to be owned, in limited amounts, by banks scattered throughout the country, and the control of which should rest in the banks, through the power of electing a majority of the directors. Subordinate to the National Reserve Association local or district reserve associations were to be formed, these also to be controlled practically by the banks organized under them. The National Reserve Bank, holding part of the reserves of all the banks, and rediscounting commercial paper submitted to it through the local reserve associations, would perform the function of organizing the credit of the whole system, and thus would limit the possibility of panics of local origin. Another part of the plan was to bestow upon the National Reserve Association the power to issue notes on general assets and thus produce the desired elasticity in the currency. The association was further to take over the bonds now held for circulation by the banks,

and in time the government was expected to refund them into 3 per cent bonds without circulation privileges that might find a place in the general investment market.

In the following year the National Monetary Commission submitted a bill essentially similar to the plan described above. The two proposals elicited widespread discussion. Public opinion, while favoring the elements of organization of credit and elasticity of issue provided by the proposed measures, was averse to the practically exclusive control to be exercised by the bankers. In the special session of 1913 measures were submitted to the House by Representative Glass and to the Senate by Senator Owen, and after extended discussion were amended and amalgamated into a measure which was enacted into law on Dec. 23, 1913. This law provided for an organization of banks in not less than 8 nor more than 12 regional reserve associations, under the ultimate control of a Federal Reserve Board. This board consists of the Secretary of the Treasury, the Comptroller of the Currency, and five other members, to be appointed by the President, two of whom must be expert bankers but not having affiliation with any bank during their term of service. Provision is made for a Federal Advisory Council, to consist of one member elected by each of the regional Federal Reserve banks to be established under the law, with power of advising the Federal Reserve Board with respect to matters within its jurisdiction. Federal Reserve banks are organized in the several districts. These are controlled by boards of directors, three of whom are appointed by the Federal Reserve Board, the rest elected by the banks in their respective districts. Every national bank is required to subscribe for stock in the Federal Reserve bank in its district. Such banks are authorized to establish branches, to deal in government and various other securities, and to rediscount commercial paper for their member banks; they may be required by the Federal Reserve Board to rediscount commercial paper for other Federal Reserve banks. After two years from the passage of the bill the Federal Reserve banks may purchase from member banks United States Government bonds, held for circulation, and take out circulation on them; or such bonds, at the request of the Federal Reserve bank, may be refunded into 3 per cent bonds without the circulation privilege. By this device it is sought eventually to retire the bond-secured note circulation. A new form of circulation is provided for under the form of Treasury notes, to be prepared by the government. When a Federal Reserve bank desires to take out such circulation, it is required to place rediscounted commercial paper in the hands of one of its directors, designated as a Federal Reserve Agent, and receive Treasury notes therefor through him. For such notes as it puts into circulation it is required to keep in its vaults a reserve in gold equal to 40 per cent of the notes. If the reserve falls below 40 per cent, a heavy tax is placed upon the circulation.

The distinction in the old law between central-reserve cities, reserve cities, and other cities is retained, as a basis for differences in reserves required of national banks. In central-reserve cities the total reserves of a bank are fixed at 18 per cent of demand liabilities and 5 per cent of time deposits; in reserve cities the reserves are 15 per cent and 5 per cent, respectively; in

other places, 12 per cent and 5 per cent. For two years after the passage of the law, five-twelfths of the reserve of the banks in the last class must be held in the bank's own vaults; at the end of two years, four-twelfths. The remaining part of the reserves held at the passage of the law by banks in reserve cities must gradually be withdrawn and redeposited with the regional Federal Reserve bank until five-twelfths has been so redeposited. At the end of three years all the bank's reserve must be held either in its own vaults or by the Federal Reserve bank. Similar provisions require a gradual readjustment of the reserves of reserve and central-reserve cities, until, in the former case, five-fifteenths of the reserve are held in the bank's vaults and six-fifteenths in the Federal Reserve bank; in the latter case the proportions are six-eighteenth and seven-eighteenth, respectively. The unassigned reserve at the end of three years must be kept either in the bank's own vaults or in the Federal Reserve bank. The latter is required to hold a reserve of 35 per cent against its deposits.

From the profits earned by Federal Reserve banks 6 per cent cumulative dividends are set aside for the stockholders (member banks). Of excess net earnings one-half must be paid to the Federal Treasury as an excise tax; one-half is set aside as a surplus fund, until such fund equals 40 per cent of the capital of the Federal Reserve banks; thereafter all excess profits are covered into the Federal Treasury.

National banks are the only banks of issue in the United States. But the States have chartered several forms of deposit banks in large number, while private bankers are also numerous. The business operations of State Banks differ from those of national banking associations only in so far as they lack the feature of note issues. On the other hand, the loan and trust companies present some variations. In so far as they do a banking business, they differ from the State and national banks in paying interest on deposits. They are, moreover, generally restrained by law from discounting mercantile paper, and their loans are made upon collateral. The peculiar features of savings banks call for no extended notice here. Both their deposits and their investments are, as a rule, of a more permanent character than those of other banks. The relative strength of the several forms of banks and other points which summarize banking operations in the United States are given in the accompanying tables.

Banking in England. In the banking system of England the central figure is the great Bank of England. This bank, the most important in the world, was projected by William Paterson (q.v.) and was incorporated July 27, 1694. It was constituted as a joint-stock association, with a capital of £1,200,000. In return for the loan of its entire capital to the government, it received the right to issue notes and a monopoly of corporate banking in England. It was not until early in the nineteenth century that this monopoly was broken down. At its very outset the Bank of England was a servant of the government; and in a lesser or greater degree it has enjoyed this character through all the stages of its subsequent history. At first the charter of the bank was for 11 years only; but in consequence of the great services of the institution to the government, its charter has been at various times renewed. The last renewal

was in 1844, and the charter of that year still subsists, its terms being subject to modification or revocation by the government at pleasure. By the Act or Charter of 1844 the bank was divided into two departments—the *issue* and the *banking*. What led to the division was this: it was supposed that, when a foreign drain of gold should set in, it would, if the currency or circulation in the country had been purely metallic, have produced a contraction of the circulation, and a consequent fall of prices, and, as an ultimate result, the cessation of the drain. It was further supposed that banks could issue their notes to any extent they pleased, and that since excessive issues increased the currency, they naturally led to inflated prices, which in their turn led to foreign drains. It was also believed that, on the occasions of these drains, the continued issues prevented the natural and desirable contraction of the circulation and aggravated the commercial convulsions occurring at such periods. The object of the Act of 1844 was to prevent issues of notes beyond a certain amount, unless against an equal amount of gold held by the issuing bank, so that the mixed currency of notes and coin might thus expand and contract like a self-acting metallic currency. Experience, however, has shown that, when these foreign drains occur, the gold exported is taken chiefly from the reserves in the Bank of England, being withdrawals of deposits or loans by the bank; and that the amount of notes in the hands of the public has not been affected by the legislation of 1844. In practice, whenever there are signs of a foreign drain, and the reserve of the bank is diminishing, the bank counteracts the tendency to a drain by raising the rate of discount and restricting its loans; the purchasing power of the public is thereby limited, and prices kept down; and at the same time gold is attracted to England for investment. The circulation is in reality not interfered with. It was also intended by the Act of 1844 to add to the security of bank notes by insuring a supply of gold to meet the payment of them at all times. But the solvency of the Bank of England is undoubted; its notes would at any time be taken as gold; and this effect of the Act of 1844, and the supplementary Act of 1845, has in the case of the notes of other banks been hitherto inappreciable.

In the *issue* department of the Bank of England the sole business is to give out notes to the public. Before the separation of the departments the government was indebted to the bank £11,015,100. This sum was declared to be now a debt due to the issue department, and for the issues of notes to that amount no gold need be held by it. This was just the same thing as if the bank had originally lent £11,015,100 of its notes to government, and these notes had found their way into circulation. The bank was also allowed to issue notes on securities without holding gold. The amount of notes which may thus be issued, without gold being in reserve against it, is £17,775,000. All notes issued above that amount can be issued only in exchange for gold. At the passing of the act in 1844 the limit of notes to be issued against the government debt and securities was fixed at £14,000,000—past experience having shown that there was not the least risk of there being at any time less than that amount of Bank of England notes in the hands of the public. The subsequent addition of £3,775,000 arose from the fact that

when other banks of issue then in existence ceased to issue, notes equal to two-thirds of their circulation were, by the terms of the act, to be issued by the Bank of England. The profit the bank derives from its issue department is the interest received on the government debt and securities, less the amount paid as taxation and the expenses of the department. The bank also makes a profit upon bullion and foreign coin. These are brought to the bank for notes; they are worth £3 17s. 10½d. per ounce; but the bank is obliged by its charter to purchase them at £3 17s. 9d. The holders prefer taking this price to having their bullion and foreign coin coined, free of charge, at the public mint, as the delay in the coining is equal to a loss of interest of 1½d. per ounce. The amount of notes in the hands of the public averages about £25,000,000; but the amount issued by the *issue* department is greater. The difference is the amount lying in the *banking* department, and represents the reserve of gold of that department; i.e., the banking department retains only a half or three-fourths of a million of coin, and transfers the bulk of its reserve to the issue department in exchange for notes. The reserve of the banking department is regarded as gold, though it consists of notes issued by the other department.

Viewed in its banking department, the bank differs from other banks in having the management of the public debt and paying the dividends on it; in holding the deposits belonging to the government and making advances to it when necessary; in aiding in the collection of the public revenue and in being the bank of other banks. For the management of the public debt the bank receives about £247,000, against which there has to be set £124,000 of charges. The remaining profits of the bank are derived from its use of its deposits, on which it allows no interest, and of its own capital. The capital was originally £1,200,000; in 1816 it reached £14,553,000—the present amount. The bank accumulates a surplus known as the *Rest*, which amounted in 1912 to £3,250,000. The reserve is about £3,000,000. In December, 1912, the deposits and current accounts were £51,900,000. Government securities held by the issue department amounted to £18,450,000; the banking department held £49,810,000.

In 1797 the bank, being on the verge of bankruptcy, was ordered by the government to suspend the redemption of its notes in coin, and the notes became the main currency of the nation until the resumption of specie payments in 1821. The notes during this interval not having been convertible into coin on demand, there was no check upon the bank in the amount of its issues, and the currency became depreciated. It is, however, said that the value of gold at the time was enhanced owing to absorption by hoarding and by military chests, and that the depreciation was more apparent than real. The export of gold following on a rise of prices occasioned by an issue of bank or government notes is unlimited, except by exhaustion, if these notes are not payable in coin on demand, and are issued without any check from without or self-imposed. But as prices estimated in these notes rise, the price of bullion, like other commodities, rises too, and the price of coin which can be converted into bullion, or be used abroad at its previous purchasing power, rises also. Since 1821 the bank has more than once been on the verge of a

suspension of payments, owing to foreign drains of gold. The separation of the bank into two departments is regarded by many as having a tendency to produce a suspension in times of panic, when the reserve is reduced by withdrawals to supply a foreign drain or to meet an internal run. Before the separation the bank, in the case of withdrawals of gold, had the whole amount of gold within its vaults to meet them; but now it loses the command of all the gold in the issue department. It cannot get that gold unless in exchange for notes, but, its reserve being reduced or exhausted, it has none to spare. The restriction of credit consequent upon the approach to an exhaustion of the reserve of the banking department is so great that the fear of it occasions a panic; and in 1847, 1857, and 1866, on the possible suspension of payments by the banking department, owing to a reduction of its reserve, being apparent, the government of the day took the responsibility of authorizing the bank to lend additional notes, not represented by gold, which was an indirect way of getting at the gold in the issue department, where the object of the borrowers was to obtain gold. The Bank of England is situated in the centre of London; but it has two branches in the metropolis and nine branches in the provinces.

Other Banks in England and Wales. While the Bank of England long held a monopoly of banking in London, it could not prevent the rise of banks throughout the provinces. In the first instance these banks were merely private partnerships, and the number of partners could not exceed six. These country banks issued notes, and were without any government supervision or control. After the panic of 1825 a law was passed permitting the country banks outside of a radius of 65 miles from London to organize as joint-stock companies, with their right to issue notes unimpaired. The Bank of England strenuously but ineffectively opposed the extension of the joint-stock principle, which had been conceded in the provinces, to the London banks. In 1833 an Act of Parliament authorized the establishment of such banks in London, though it refused to give them the note-issuing privilege. When the Bank of England was re-chartered in 1844, all joint-stock banks and private banks were restrained from issuing further notes, though they were authorized to maintain the circulation then outstanding, calculated on the average of the twelve weeks prior to April 27, 1844. At the time the Bank Act went into effect, the outstanding issues other than Bank of England notes were £5,153,417 for 207 private banks, and £3,478,230 for 72 joint-stock banks. In the course of time the number of issuing banks decreased, so that in 1910 there remained only 27 private banks and 24 joint-stock banks, having note issue privileges to the extent of £543,000.

Banks in Scotland. The earliest banking institution in North Britain was the Bank of Scotland, instituted by a charter of incorporation from the Scottish Parliament in 1695. The original capital was £1,200,000 Scots, or £100,000 sterling. In 1774 the amount of stock was extended to £200,000 sterling; now it is £1,250,000 sterling. In 1727 a new and similar establishment was constituted under the title of the Royal Bank of Scotland, whose advanced capital is now £2,000,000. In 1746 another association was formed, and incorporated by royal charter,

with the title of the British Linen Company. From £100,000 its capital has increased to £1,000,000. Besides these three banks, there are in Scotland 10 other joint-stock banks, but no private banks.

In consequence of allowing interest on deposits, the banks in Scotland may be said to hold the whole currency of the country, minus only the money passing from hand to hand. This widespread system of depositing is greatly aided by the establishment of branches from the parent banks, and these branches are found in every small town in the kingdom. The entire number of branch banks in Scotland is over 1000. At these branch banks the agent (who is usually a responsible person in business) discounts bills within certain limits, issues letters of credit, and pays out notes, and also gives cash on demand for them; though, strictly, the notes of a bank are payable on demand at the head office only. By a strict system of supervision Scottish branch banks are usually well conducted and are of great service in every department of trade.

The banks in Scotland, like the banks in Ireland, but unlike the provincial banks in England, are allowed to issue notes beyond their fixed issues, on holding gold equal in amount to the extra issue. But as the gold thus retained is, like the other gold in reserve, liable for all deposits, as well as for the whole circulation of a bank if it should fail, the security of the establishment is increased only in a small degree by this arrangement, which, apart from the loss of profit to the bank on the gold unemployed, is attended with inconvenience at those seasons when the circulation is extended. In Scotland, and Ireland also, banks can issue one-pound notes; the English banks are not permitted to circulate notes of less value than £5.

Besides employing money in discounting bills, the Scottish banks grant loans of fluctuating amount, called *cash accounts* or *cash credits*. By a cash account is signified a process whereby an individual is entitled to draw out sums as required, to a stipulated amount, and on an implied condition to make deposits at his convenience toward the liquidation of the same. On entering into this arrangement, he finds security to the bank that he will repay to the bank, whenever called on, the balance of sums drawn out, less those paid in, with the interest that may be due. These accounts are balanced yearly, like current or deposit accounts.

Banks in Ireland. There are eight joint-stock banks, having 596 branches and sub-branches. Their aggregate circulation in 1911 was £4,171,907. The circulation of the Bank of Ireland was £2,942,694. This bank was established in 1783, with privileges resembling those of the Bank of England. Its capital is £2,769,230, and its reserve £1,036,000. The capitals of the other banks vary from £142,766 to £1,500,000, and the total capital of the banks in Ireland is £7,309,230. Six are banks of issue. Interest is allowed on money deposited for a stated period, but not on money at call, or as a rule on current accounts.

The following table, including the chief banks and joint-stock banks of England, Wales, Scotland, Ireland, and the Isle of Man, gives some of the important features of the assets and liabilities of banks doing business in the United Kingdom for the date of June 30, 1911:

Location	No. of banks	No. of branches	Capital	Reserve	Circulation	Deposits and current acc'ts	Cash, money at call and short notice
Bank of England	1	11	£14,553,000	£3,000,000	£29,431,330	£63,042,511	£40,437,768

Continental Banks. On the continent of Europe there are both private and state banks. The Bank of France stands second in repute only to the Bank of England. It was founded in 1800, and in 1806 was placed upon an enduring basis. Its original capital was 45,000,000 francs, which was increased in 1806 to 90,000,000 francs, and later reduced to 67,900,000 francs, with a reserve of 12,980,750 francs. It has the sole right to issue bank notes in France and enjoys a high degree of public confidence, which it is so anxious to retain that in 1888, when dangerous counterfeits of its 1000-franc notes were put into circulation, it preferred to redeem them rather than, by refusing payment, to impair the general readiness to receive its own genuine paper. The Bank of France has often rendered important services to the French government in furnishing large and promptly given loans. In November, 1890, during the crisis in the London money-market owing to the embarrassment of the firm of Baring Brothers, the Bank of France was able to relieve the pressure on the Bank of England by a large advance of gold. It issues notes of 50, 100, 500, and 1000 francs, and, besides carrying on a general banking business, takes charge of valuables, such as plate, jewels, and title deeds, at a charge of one-eighth per cent of the value of the deposit for each six months. It has various branches or *succursales* in the chief cities of France. The Banque Nationale of Belgium is conducted upon the model of the Bank of France. It issues notes for 20, 50, 100, 500, and 1000 francs. In Germany the Imperial Bank (Reichsbank) was established by an act passed in 1875, with the right to issue notes not covered by bullion in the vaults, to the amount of 250,000,000 marks (\$62,500,000); while a number of subordinate banks are permitted to issue uncovered notes to the amount of 135,000,000 marks (\$33,750,000). Notes are issued for 5, 50, 100, 500, and 1000 marks. The state itself (by an act passed in 1874) may issue 120,000,000 marks in small notes for the general convenience of the public. For a more detailed treatment of the banking systems of foreign countries, see articles on those countries.

Historical Sketch. The origin of banking is in remote antiquity, but in its nature and scope great changes have been made during the last four centuries. The modern banker is a dealer in credit, while in ancient times the so-called banker was a mere custodian of other people's money and a buyer and seller of foreign moneys. The bill of exchange appears to have been the first credit instrument handled by the early bankers. Explorers have discovered evidence of its use in Assyria several thousand

years before Christ. In Athens and in Rome several hundred years before Christ, men who would now be called bankers made a business of receiving money on deposit and of buying foreign money and foreign bills of exchange. In Rome bankers were called *argentarii*, or dealers in money. Although at first their profits came altogether from commissions upon deposits and from the exchange of domestic for foreign money, they finally became dealers in bills of exchange, and even loaned the money which had been intrusted to them, a credit on their books being transferred by an order resembling the modern check. Livy mentions the *argentarii* as appearing as early as 350 B.C., and they are frequently referred to in later Latin literature. They were not patricians and had no social status, being despised by the nobles and hated by the common people. By the time of Justinian the business of banking, involving a comparatively large use of credit, had become firmly established, and a complete body of jurisprudence relating to the subject had been developed.

During the Middle Ages the insecurity of property and the risks attending commerce practically reduced the business of banking once more to that of mere money changing. In Italy, at this time, the bankers were known as *campesores*, or dealers in foreign money. There was still traffic in bills of exchange; but for several centuries banking in the modern sense of the term, implying the lending of other people's money, the issue of notes as a medium of exchange, and the transfer of accounts by order or check, was practically unknown. The rise of modern banking really dates from the establishment at Venice of the Banco di Rialto in 1587. For two centuries prior to this date private bankers in Venice had been receiving deposits, making loans, and transferring credits upon order. The Banco di Rialto received deposits subject to call, and permitted its customers to transfer their credits by order. In 1619 this bank was absorbed by the Banco del Giro. This bank loaned 500,000 ducats to the government of Venice. Depositors were given receipts in proportion to the weight of the gold or silver coins which they deposited, and these receipts were used as money. As the current coinage in Venice was in bad condition, it often happened that credits upon the Bank of Venice were at a premium. On several occasions, however, the paper of the bank was at a discount, on account of excessive issues. The bank survived until 1805, when its affairs were liquidated under a decree of Napoleon.

The Bank of Amsterdam and the Bank of Hamburg, established in the same century as the

Banco del Giro in Venice, performed banking functions of a similar character. They did not issue bank notes and were not authorized to make loans; but their credits, based upon coins deposited, became a very popular medium of exchange in the settlement of all large transactions. These credits were known as "bank money" and are generally regarded as the first step in the evolution of the check and deposit system now in common use in Europe and the United States. The Bank of Amsterdam was successfully managed from 1609, the date of its establishment, until the middle of the following century, when secret advances to the Dutch East India Company resulted in the destruction of its credit. It was liquidated by a royal decree in 1819. The Bank of Hamburg was always conservatively managed, and survived until 1873, when the adoption of an Imperial coinage and bank currency rendered its services no longer necessary.

It was during the eighteenth century that the two characteristic features of modern banking—the issue of notes not covered by coin, and the granting of deposit accounts upon the mere credit of borrowers—were finally evolved. China appears to have been familiar with bank notes for at least twelve centuries, but their use in Europe dates only from 1661, when the Bank of Sweden issued notes to avoid the transportation of copper coin. In England the recognition of the bank note as a representative of credit rather than as a mere warehouse receipt secured by an equivalent deposit of coin, was not realized until the end of the seventeenth century, when the Bank of England was created. The Bank of Scotland, chartered in 1695, received privileges similar to those possessed by the Bank of England.

See also CREDIT; CURRENCY; INTEREST; SAVINGS BANK.

BANK BILLS, or NOTES. The promissory notes of a bank or banker, issued under special legal authority, payable to bearer on demand. They differ from an ordinary promissory note in two important particulars: they may be re-issued after payment, and they do not become stale, or overdue, by the expiration of a reasonable time after their issue. Bank of England notes are a legal tender in England for all sums exceeding £5, except by the bank. In the United States bank bills are not a legal tender. Whether

a demand or payment must be made before an action can be brought on a bank bill is a question upon which the decisions in the United States are in conflict. Consult the authorities referred to under BANK, BANKING.

BANK DIS/COUNT. See BANK, BANKING.

BANK HOLIDAYS. In law, days on which obligations, such as promissory notes or bills of exchange, may not be demanded so as to put the maker or payer thereof in default. In England every Sunday, Christmas Day, Good Friday, Easter Monday, the Monday in Whitsun Week, the first Monday in August, the 26th of December (called *Boxing Day*), or, if that day is Sunday, the 27th, or any day appointed by Order in Council in place of either of the last four days, and any day appointed by royal proclamation as a public fast or thanksgiving day, are bank holidays. Banks are to be kept closed on such days, and bills and notes payable on any of these days are declared payable on the next following business day. In the United States Sundays and public holidays (q.v.) are, as a rule, bank holidays; and negotiable paper payable on such day, without grace, is payable the next business day. If it is entitled to days of grace (see BILL OF EXCHANGE), and the last day of grace falls on a public holiday, it is payable on the last preceding day, in the absence of a statute varying this rule. Such statutes, making the bill or note payable on the day following instead of the day preceding the holiday, where the last day of grace falls on the holiday, have been enacted in several of the United States.

BANKIPUR. A civil station adjoining the city of Patna (q.v.), British India.

BANK NOTES, MANUFACTURE OF. The chief aim in the manufacture of bank notes is to render counterfeiting impossible, or, at least, easy of detection. This is usually accomplished by peculiarity of paper, design, ink, and printing, or by a combination of these means. English bank notes are printed with the blackest and most indelible ink on a peculiar kind of hand-made paper bearing a distinctive watermark. (See PAPER.) As a further security against counterfeiting, a self-registering machine is used for impressing upon the note a mark known only to the Bank of England officials. Until 1837 copperplate printing was employed for English bank notes; and from 1837 to 1855 the method of Perkins Heath for the reproduction of designs by the mill and die process was employed. The great advantage of this method was that a large number of steel plates of the same pattern could be produced from an original with comparative ease. In 1855 electrotype printing was introduced by Smee and the mechanical officials of the Bank of England, and since that time all English bank notes have been printed from the electrotype plates.

The extensive use of Treasury notes or other forms of paper currency in the United States led the Bureau of Engraving and Printing of the Treasury Department at Washington to develop methods for producing notes which should not only be difficult to counterfeit, but which should be legible, durable, and artistic in design. In many instances celebrated artists have been engaged to furnish designs for notes; but more generally the designs have been prepared by the artists belonging to the Bureau. Whoever the designer may have been, the work of transferring the design to the plate, and the entire mechanical

production of the note, except the manufacture of the paper, is carried out by the Bureau.

The paper is made by a private concern only for the government, the process of manufacture being patented. It is made by machinery and is tougher than that of the Bank of England, which is made by hand. The principal ingredients of the paper are linen and cotton fibre, into which threads of silk are introduced lengthwise in the sheets in such a manner as to be visible in the printed note. The process of manufacture, as carried on at the Bureau of Engraving and Printing, is as follows:

The design of the note, including all the lettering and devices thereof, upon a sheet of the required form, being in the hands of the workmen, they first proceed to make the die. A plate of soft, highly polished steel is selected, and upon it is sketched the design, or such portions of it as are of the same color, if more than one tint is to be used in printing. A separate die is needed for every shade used. This is then carefully engraved. It will be understood that, unlike the method of wood engraving, the lines which take the ink are cut into the plate instead of being raised above its surface. The engraver is limited to such parts of the work as can be done by hand; other portions, such as the fine scrolls and elaborate tracery, are done entirely by machinery. The principal apparatus used is a complicated piece of mechanism, which actuates a plate to which the steel for the die is attached and caused to press against a diamond point. This is known as a cycloid ruling machine and is employed for the straight work. Perfectly true and delicate lines are thus cut into the metal, making figures technically termed "cycloid rosettes." The geometric lathe used for the elaborate work on the back of the different denominations of paper money requires the services of an expert mathematician to figure out the succession of curves, and once the combination is changed the original figure in its detail never can be reproduced.

The die, being complete, is ready for the transfer process. Postage stamps, for instance, are made in sheets of 200, so that the die must be transferred that number of times on a single plate. It is first casehardened and then put, face up, in a press which is made with a combination of levers actuated by the foot, so as to give the tremendous pressure of 21 tons on a single line. A cylinder or "roll" of soft steel is, by careful gauging, placed so as to rest directly over the face of the die and at the same time is so arranged as to revolve easily along its surface even when under the full weight. The pressure is then applied, with the result of forcing the soft steel of the roll into the lines of the engraving, so that, when complete, the periphery of the cylinder shows an exact reproduction of the face of the die, only the lines sunk on the die are now raised on the roll. Next, the cylinder is casehardened. Then the plate—soft steel again—to be used for the final printing is placed in the press, and the roll is arranged above it. Now the cylinder leaves its impression on the plate, the hard steel of the raised lines cutting deep into the surface, so that a precise duplicate of the original die is obtained. This is repeated as many times as there are to be repetitions of the stamp or note on the single plate, which is then ready for use.

The ink for printing is made on the spot. In a large room are ten or a dozen paint mills,

which are busily grinding the colors and oil together. Two large ones are filled with green ink, another with vermilion, while others are making blue, red, and other tinted inks.

The next important department is the paper-room, where the paper is received and cut in sheets of the required size. The notes are made of a peculiar material containing colored fibres. The paper for postage stamps is made of the best linen. It is of short fibre, very fine, and extremely strong. The sheets on which currency is to be printed are counted as soon as received, and the results reported for verification. They are placed in heaps, marked off in sets of 100 and 1000.

The Bureau of Engraving and Printing employs both hand and power presses, steam presses being used exclusively for printing the backs of treasury and bank notes and for revenue and postage stamps. In the power presses the operations are practically the same as with the hand presses, but are performed automatically by the press itself. The more recent types of power presses print from plates bent in cylinder form.

As soon as a printer has completed the work assigned to him he hands it, made up in "books" of 100 impressions, each sheet inclosed between two others of brown paper, to a clerk. He is then credited with his delivery, spoiled sheets being counted the same as perfect ones, so that if his return is correct his debit account on his pass book, which is kept in a different apartment and by other employés, is thus balanced. The finished impressions are now carefully counted and inspected. A day's work for a hand printer consists of from 800 to 1000 impressions, each sheet containing four bills. The spoiled ones are removed and sent to the proper agents to be burned, while the others are hung in the drying room. This apartment is heated by steam pipes, and the paper is suspended by wires for a day or two, until perfectly dry. Then the brown paper is removed, and the sheets, packed between leaves of press-board, are subjected to the action of a powerful hydraulic press. They are then once more inspected and counted. The entire process of printing requires about one month, and each sheet is counted about 50 times before the packages of 1000 are transferred to the vaults of the Treasury Department.

BANKHEAD, JOHN HOLLIS (1842—). An American public official and legislator, born in Moscow, Ala., and educated in the public schools. After four years of service with the Confederate army in the Civil War he entered politics. In 1865-67, and again in 1880-81, he was a member of the Alabama House of Representatives, and in 1876-77 a State Senator. He held the position of warden of the Alabama penitentiary from 1881 to 1885. Soon afterward (1887) he was elected to the Fiftieth Congress, and from that time until 1907 he served continuously. In the latter year he was appointed a member of the Inland Waterways Commission. At the Democratic primaries in Alabama in 1906 he had been nominated an alternate Senator to succeed J. T. Morgan in event of the latter's death (see ALABAMA, *History*), and consequently in June, 1907, Senator Morgan having died, Bankhead was appointed United States Senator, and in July was elected by the Legislature. He was reelected in 1911 for a full term of six years, beginning March 4, 1913.

BANK OF NORTH AMERICA. See BANK, BANKING.

BANK OF THE UNITED STATES. See BANK, BANKING.

BANKRUPTCY (*bank* + Lat. *ruptus*, broken, from *rumpere*, to break, It. *banca rotta*, usually taken to refer to the former Italian custom of destroying the money counter when a bank failed). In popular usage, the inability of a person to pay his debts, or the financial condition of one who has failed in business; as a technical law term, the status of one who has been adjudged a bankrupt.

The legal position of a debtor in primitive communities is one of great hardship. He is at the mercy of his creditor, who, after exhausting the property of the debtor, may generally seize his body and force him to work out the debt or become a slave. With the development of society various devices are resorted to for the amelioration of the debtor's condition, terminating, as a rule, in a more or less satisfactory system of bankruptcy, the cardinal principle of which is that one who is unable to pay his debts in full may be discharged therefrom upon giving up all his property for ratable distribution among his creditors. The history of bankruptcy and insolvency legislation in England furnishes a good illustration of this statement. While it is true that there was no process of the common law by which a man could pledge his body or surrender his liberty for the payment of his debts, the courts permitted a legal fiction to grow up that a debtor who did not pay a judgment against him was guilty of a breach of the peace, subjecting his body to imprisonment by the writ of *capias ad respondendum*. The first bankruptcy act in England was passed about the middle of the sixteenth century. It reflects the harsh and unfeeling attitude which the property classes, which controlled the courts and the legislation of that period, entertained toward the insolvent debtor. This act (34 and 35 Hen. VIII, c. 4) was entitled "Against such as do make Bankrupt," and recites that "divers and sundry persons, craftily obtaining into their hands great substance of other men's goods, do suddenly flee to parts unknown, or keep their houses, not minding to pay or restore to any, their creditors, their debts and duties, but of their own wills and pleasures consume the substance obtained by credit of other men for their own pleasure and delicate living, against all reason, equity and good conscience." It then proceeded to confer upon various judicial officers power to take the offending debtors and their property; to sell the latter, and to divide the proceeds ratably among creditors. Under Elizabeth and James I additional bankruptcy statutes were passed, all keyed to the same note of suspicion and harsh judgment of the failing debtor. The Act of 21 James I (c. 19) was especially severe, providing that the debtor who could not render some just reason why he became bankrupt should stand upon the public pillory, have one of his ears nailed thereto, and then cut off. If his failure to pay his debts was due to fraudulent practices, he might be put to death.

With the growth of English trade the hazards of commercial enterprises were so multiplied, and the complexity of business relations so increased, that this Draconian legislation against failing debtors was found to be not only unjust but impolitic. Accordingly bankruptcy laws underwent a radical change, until, in Black-

stone's time, they were considered "as laws calculated for the benefit of trade, and founded on principles of humanity as well as justice; and to that end," adds the great commentator, "they confer some privileges, not only on the creditors, but also on the bankrupt or debtor himself. On the creditors, by compelling the bankrupt to give up all his effects to their use without any fraudulent concealment; on the debtor, by freeing him from imprisonment and discharging him from his debts, if he had been honest."

These laws, however, applied only to traders, because it was thought that they were, "generally speaking, the only persons liable to accidental losses," and that it was "an unjustifiable practice for any person but a trader to incur himself with debts of any considerable value." Those who were not traders could get relief from imprisonment for debt only to the extent provided by an entirely distinct set of statutes, those relating to insolvency (q.v.). Although Blackstone describes the bankruptcy laws of his age in the most optimistic vein, deeming them, as he did almost every other branch of English law, the perfection of human reason, they have been modified repeatedly during the last 100 years. Thirty-eight bankruptcy acts have been passed in England, beginning with that already mentioned under Henry VIII, and, for the present, closing with the Act of 1883, as amended in 1890. These statutes have been a series of experiments, and although the latest had for its motto, "The estate for the creditor, not for the debtor, nor for the trustee," it cannot be considered a finality, for it has not accomplished its avowed purpose of satisfying the creditor class. This is shown by the fact that nearly one-half of the business insolvencies in England are liquidated under deeds of settlement or voluntary compositions with creditors outside of the bankruptcy court.

Under the present bankruptcy acts in England and in the United States, proceedings in bankruptcy may be instituted by the debtor or by creditors. The former is called a voluntary, the latter an involuntary proceeding. Each is begun by filing a petition. The debtor's petition must state that he is unable to pay his debts and is willing to surrender all of his property to the use of his creditors. Whether a person is liable to be adjudged a bankrupt upon the petition of creditors depends upon his having committed an act of bankruptcy. The United States Bankruptcy Statute of 1898 as amended in 1903 enumerates five classes of acts of bankruptcy. First, conveying, or removing, or permitting to be removed, any of his property with the intent to defraud any of his creditors; second, transferring, while insolvent, any of his property with intent to prefer a creditor; third, suffering, while insolvent, any creditor to obtain a preference through legal proceedings, and not securing the discharge of such preference; fourth, making a general assignment for the benefit of creditors; or, being insolvent, applying for a receiver for his property, or because of insolvency having a receiver put in charge of his property; fifth, admitting in writing his inability to pay his debts, and his willingness to be adjudged a bankrupt on that ground.

After the debtor is adjudicated a bankrupt, a trustee is appointed by the creditors (subject to some supervision by the Board of Trade in England, by the bankruptcy court in this country), who becomes vested not only with all the prop-

erty in possession of the debtor at the time when he was adjudged a bankrupt, but with all that he had transferred in violation of the statute or in fraud of creditors. It is important that the trustee's title should relate back of the adjudication. By providing for the relation back of the trustee's title, every transfer of his property made or suffered by an insolvent debtor, with intent to prefer a creditor over others, within three months in England, four months in the United States, before the filing of the petition in bankruptcy, is rendered invalid, and the property may be brought back into the estate for division among creditors. Moreover, even when a creditor has obtained security from the debtor, which is not invalidated by the statute, he is not allowed to share in the bankrupt's estate unless he turns over the security to the trustee, or deducts from the amount of his claim the value of his security. It is the duty of the bankrupt to make a full disclosure and surrender of his property, save such as is exempted by statute, as well as to supply a full and honest list of his creditors. Upon establishing their claims, in the prescribed manner, the creditors are entitled to take part in the meetings provided for by statute, as well as to receive dividends. The debtor may be punished criminally for certain violations of the bankruptcy law; and a discharge from debts will be denied for various reasons. Under the present Federal statute it will be denied if he has committed an offense punishable by imprisonment, as provided therein, or if he has fraudulently destroyed, concealed, or failed to keep books of accounts, or records, showing his true financial condition, or obtained property on credit by a materially false statement in writing, or within four months prior to petition transferred, or removed, destroyed or permitted to be removed, destroyed, or concealed, property with intent to defraud, or in voluntary proceedings been granted a discharge in bankruptcy within six years, or in the course of the proceedings in bankruptcy refused to obey any lawful order of the court. Even when a discharge is obtained, it does not relieve the bankrupt, as a rule, either in England or here, from debts grounded in fraud or other moral misconduct. In this country no political disability follows an adjudication in bankruptcy. In England, however, an adjudged bankrupt is disqualified from sitting or voting in either house of Parliament or from holding various other specified offices. This disqualification ceases as soon as the bankrupt is discharged, if the court certifies that he was free from misconduct, and at the end of five years from a discharge in other cases.

Article I, Sec. 8, of the Federal Constitution, gives to Congress power "to establish . . . uniform laws on the subject of bankruptcies throughout the United States." This grant of power to Congress does not exclude the States from legislating on this subject, but a Federal bankruptcy statute suspends while in force, the operation of a State statute covering the same ground. Congress has exercised this power but sparingly. It passed the first bankruptcy law in 1800. This was copied 'quite closely from the English statute of that time. As it applied only to traders, it soon became unpopular with other classes and was repealed in 1803. The next venture in bankruptcy legislation by Congress was made in 1841, at the request of insolvent debtors, who, after the panic of 1837, had become a numerous and influential class.

This bill proved no more satisfactory than its predecessor, and it was repealed after a short life of two years. After the repeal of this act no serious attempt was made to pass a Federal bankruptcy law until 1864, when Congressman Jencks, of Rhode Island, introduced a bill upon this subject. His very instructive speech, explanatory of its purpose and provisions, is contained in the *Congressional Globe* for 1863-64, at page 2636. The bill met with serious opposition and did not become a law until June, 1867. In 1874 it was amended in various respects. One of the changes required one-fourth in number and one-third in value of the creditors to unite in an involuntary petition. This made it very difficult for creditors to force a debtor into bankruptcy, and thereafter the proceedings were mainly voluntary. Moreover, the charges upon bankrupt estates under this law were heavy, often exorbitant, and the creditor class was disappointed in its workings. Their agitation for its repeal was crowned with success in 1878.

Twenty years elapsed before the fourth and present Act was passed by Congress in 1898 (amended by subsequent acts of Congress in 1903, 1906, and 1910). It was the outcome of a compromise between the friends of a bill fashioned largely after the present English statute, and those who were either opposed to any Federal legislation on the subject, or were anxious to limit such legislation within the narrowest possible bounds. Its definition of acts of bankruptcy is much narrower than that of the English statute. Even one who has committed an act of bankruptcy may defeat an adjudication by convincing a jury that the aggregate of his property is, at a fair valuation, sufficient in amount to pay his debts. It secures, however, a fairly expeditious, convenient, and economical administration of bankrupt estates. While the Federal district courts have original jurisdiction in bankruptcy, the statute provides for referees, who may perform many of the judicial duties in bankruptcy proceedings, and whose districts are not to extend, as a rule, beyond the limits of a single county, thus making it easy for suitors to attend upon the proceedings. Consult: Brandenburg, *Law of Bankruptcy* (3d ed., Chicago, 1903); Bump, *Law and Practice in Bankruptcy* (11th ed., Washington, 1898); Collier, *Law and Practice in Bankruptcy* (9th ed., Albany, 1912); Baldwin, *Concise Treatise upon the Law of Bankruptcy* (8th ed., London, 1900); Robson, *Treatise on the Law of Bankruptcy* (7th ed., London, 1894).

BANKS, SIR JOSEPH (1743-1820). An English naturalist. He was born in London, Feb. 13, 1743, the only son of William Banks and Sarah, daughter of William Bale, who left him a large fortune. He graduated at Oxford, imbued with a profound interest in natural history, and it was by his exertions that lectures in natural history were first introduced into that university. In 1766, after having been elected a fellow of the Royal Society, he began his travels by a journey to Newfoundland and Labrador to collect plants, whence he brought the first scientific collections from that region. In 1768-71 he accompanied Cook's expedition round the world in a vessel, the *Endeavour*, equipped by himself, in which he visited successively Rio de Janeiro, Cape Horn, Tahiti, New Zealand, Australia, the Malay Archipelago, Cape of Good Hope, and St. Helena. His friend, the botanist Solander, and two artists accompanied him on this expedition.

Botany Bay and the Endeavour River were named at this time, and Cook also gave the name of Banksland to an island south of New Zealand. During this visit to Tahiti Banks sowed seeds of various Brazilian plants. The death of Dr. Solander long delayed the publication of the manuscripts and plates of the botanical results of the expedition, which were preserved in the British Museum, and finally published in 1900. As one result of this expedition the marsupial fauna of Australia first became known to science. In 1772 Banks explored the Hebrides and Iceland and discovered the great geysers of the latter country. He was elected president of the Royal Society in 1778, which office he held for 42 years. While he published little himself, he did much to arouse an interest in natural science in Great Britain and was a patron and protector of scientists in general. His great collections and library, now preserved in the British Museum, were accessible to naturalists and were the basis of many important systematic works by Fabricius, Broussonnet, Girtner, and Robert Brown. He married Dorothea, daughter of William Weston-Hugessen, in 1779, but left no children. He died in Isleworth, Jan. 19, 1820. Consult Duncan, *Short Account of the Life of Sir Joseph Banks* (Edinburgh, 1821), and *Sir Joseph Banks and the Royal Society* (London, 1846).

BANKS, LOUIS ALBERT (1855-). An American clergyman and author. He was born at Corvallis, Ore., and educated at Philomath College, Ore., and at Boston University. In 1893 he was the Prohibition candidate for governor of Massachusetts and afterward became an evangelist for the American Anti-Saloon League. A few of his very numerous writings are: *Religious Life of Famous Americans* (1904); *Spurgeon's Illustrative Anecdotes* (1906); *The Problems of Youth* (1909); *The World's Childhood* (1910); *The Great Themes of the Bible* (1911); *The Lincoln Legion* (1912).

BANKS, NATHANIEL PRENTISS (1816-94). An American soldier and politician, born at Waltham, Mass., where he received a common-school education and learned the trade of a machinist. He then edited a local paper; studied law and was admitted to the bar; served several terms in the Massachusetts Legislature, for part of the time as Speaker of the Assembly, and in 1853 was chairman of the Massachusetts Constitutional Convention. In 1853, also, he was elected to Congress by a coalition of the Democrats and Free-Soilers, but soon joined the "Know-Nothings" and afterward identified himself with the newly organized Republican party. During his second term in Congress he was Speaker of the House, having been chosen on the 133d ballot. He was Governor of Massachusetts from 1857 to 1859 and then became president of the Illinois Central Railroad, which position, however, he resigned on the outbreak of the Civil War, to enter the Federal service. He was commissioned major-general of volunteers on May 16, 1861; commanded the Fifth Army Corps along the upper Potomac and in the Shenandoah valley in 1861-62, and on March 23, 1862, a part of his army under Shields defeated Jackson at Winchester. In April, 1862, at the head of two divisions, he was assigned to the task of protecting the Shenandoah while McClellan proceeded against Richmond by way of the Peninsula; but, soon weakened by the withdrawal of one of his divisions, he was defeated

by Jackson at Front Royal on May 26 and was forced back upon the Potomac. Soon afterward he joined Pope, then commanding the Army of Virginia, and on August 9 was defeated by a force of Confederates in the battle of Cedar Mountain. He then was in command for a time of the defenses of Washington, and in December, 1862, commanded the expedition to New Orleans and replaced Gen. B. F. Butler as commander of the Department of the Gulf. In the spring of 1863 he conducted the campaign against Port Hudson (q.v.), which, after resisting several assaults, was finally surrendered, July 9, 1863, on the receipt of the news that Vicksburg, farther up the river, had been taken by Grant. Early in 1864 General Banks was directed to lead an expedition up the Red River, with a view to regaining western Louisiana from the Confederates, but he was defeated by Gen. Richard Taylor at Sabine Cross Roads and was forced to withdraw to the Mississippi. In May, 1864, he was relieved of his command and, resigning his commission, was again elected to Congress, where he served, with the exception of one term, until 1877 and was for many years chairman of the Committee on Foreign Relations. He was again elected to Congress in 1888, but after 1890 suffered from a mental disorder and withdrew wholly from public life. In 1891 Congress voted him an annual pension of \$1200. Because of his factory life when a young man, he was popularly known as "the Bobbin Boy."

BANKS, THOMAS (1735-1805). An English sculptor. He was born at Lambeth and studied in the classes of the Academy, whose gold medal enabled him to prosecute further study at Rome. He remained in Italy from 1782 to 1789 and executed, among other works, the marble "Cupid Catching a Butterfly," which was acquired by the Empress Catharine of Russia during the artist's sojourn at St. Petersburg. She also gave him another commission for a group called "Armed Neutrality." On his return to London he was in 1785 elected to the Royal Academy. Several of his monuments are in Westminster Abbey and St. Paul's; in the latter is his statue of Lord Cornwallis. His most ambitious effort is his plaster model of "Achilles Mourning the Loss of Briseis." Among his other works is "Shakespeare between the Tragic and Comic Muses" in Stratford-on-Avon. Banks has been called the father of English ideal sculpture, but he may be best classed as a mediocre forerunner of the classic art of Thorwaldsen and Flaxman.

BANKS, SIR WILLIAM MITCHELL (1842-1904). A Scottish surgeon and anatomist, born in Edinburgh. He graduated in 1864 at Edinburgh University, was demonstrator of anatomy in the University of Glasgow, and subsequently at Liverpool, in 1868, became known as a consulting and operating surgeon. He reestablished the Medical School of Liverpool and founded University College, one of the three colleges constituting Victoria University. For some time he was professor of anatomy in University College. In 1886 he was elected first president of the Liverpool Biological Society, and in 1897 delivered the address in surgery before the British Medical Association assembled at Montreal. He was one of the originators of the modern method of operating for cancer of the breast. His publications include various papers and addresses.

BANKSIA. A genus of Australian shrubs of the family Proteaceae, named in honor of

Sir Joseph Banks. A few of the species become small trees. They have hard, dry leaves and present a remarkable appearance from the umbellate arrangement of their branches. These bear toward their extremities oblong heads of very numerous flowers, which secrete much honey. Some of the species are frequently grown as greenhouse plants in Great Britain. They are abundant in all parts of Australia, forming a characteristic feature of its vegetation, and are called honeysuckle trees. *Banksia grandis* exceeds all the rest of the genus in size, attaining a height of 50 feet.

BANK-SIDE. The south bank of the Thames, between Blackfriars and Waterloo bridges, London. Here stood the famous Globe Theatre in Shakespeare's time.

BANKS ISLANDS. A group of islands in the Pacific, a dependency of New Hebrides (q.v.) (Map: Australasia, J 4). They number 17 and are situated in lat. 13° S. and long. 168° E. The most important of them are Vanua Lava, St. Maria, Ureparapara (with a good harbor), and Valua. Spices, corn, and coffee are among the important products, and the islands are famous for valuable rosewood. These islands were discovered by Bligh. There is a mission house on the small islet of Mota. The total area of the group is estimated at about 150 square miles, and the population at 5000.

BANKS LAND. An island in the Arctic Ocean, 70 miles southwest of Melville Island (Map: Arctic Regions, D 7). It is intersected by the parallel of 74° N. and by the meridian of 120° W. It was discovered by Parry in 1819.

BANKS STRAIT. See Map: Tasmania, E 1.

BANK SWALLOW, or SAND MARTIN. This familiar swallow is perhaps the most widespread of all land birds, ranging over most of the Northern Hemisphere. In North America it breeds as far north as the limits of trees and migrates south to Peru and Brazil. It is found also throughout Europe, northern Asia, and China, wintering in Africa, India, and the Indo-Burmese countries. It is known under one or another name throughout nearly the whole world, wherever the cut banks of streams give it an opportunity to make its burrowed nesting place. The common species of America, Europe, and Asia is *Chvicol*a or *Riparia riparia*. From eastern India to southern China it is replaced by another species (*Chvicol*a or *Riparia sinensis*), which migrates in winter to the Philippines and southern India. Egypt has another species (*Chvicol*a or *Riparia shelleyi*); the brown-collared bank swallow (*Chvicol*a or *Riparia cineta*) abounds throughout tropical Africa, and several other forms are recognized elsewhere, but all are closely alike in appearance and habits.

The bank swallow is easily distinguishable from all other American swallows by its lesser size and the absence of metallic lustre in its plumage, which is sooty brown-black above and white on the lower surface of the body, with a dusky band across the breast; the beak is very small and weak, and the tail short and not deeply forked. This swallow is migratory in the temperate zone, where it spreads in summer to the borders of the Arctic Ocean, and retires in winter not only to the tropics, but beyond them to the southern parts of South America and Africa, but its alleged breeding there is probably erroneous, arising from confusion with local resident species. Everywhere it is of local distribution, seeking the borders of water courses

and lakes where steep banks of sandy earth afford it a chance to dig holes, which it does in companies sometimes numbering hundreds of pairs, whose homes are often crowded within a small space. Seven hundred holes have been observed in Alaska in the face of a single sand bluff. The nests are placed at the inner ends of deep burrows, each made by a pair of birds. In excavating the feet seem to be the principal instruments, scratching away the soil and scraping it out backward to the mouth of the hole, until the required calibre and depth are attained. Both sexes work at the task diligently, and the hole is sometimes 7 or 8 feet in depth—a wonderful achievement for a bird so weak and ill-provided with digging tools. A swallow of similar nesting habits, but otherwise quite different, is the Rough-winged (q.v.). See SWALLOW and Plate of SWALLOWS.

BANN. A river in Ireland, rising in the southern part of Downshire. It flows northwest, passing through Lough Neagh at its southwestern end, then passes between the counties of Londonderry and Antrim, and falls into the Atlantic at Port Stewart. The part of the river south of Lough Neagh is called the upper Bann and has a length of 25 miles, while the lower Bann, or the part north of Lough Neagh, is about 40 miles long. The Bann is navigable for light vessels and has salmon fisheries. It is connected with the Newry Canal at Portadown.

BANNATYNE (băn'a-tin) CLUB. A club founded in 1823 by Sir Walter Scott, who was its first president, and by other Scottish antiquarians, for the purpose of collecting and publishing all history and literature connected with their country. It was named after a sixteenth-century collector of Scottish poetry, and was discontinued in 1859. During its existence it printed 116 rare works in editions of 100 copies each, which were distributed among the members. A full set of these works brought £235 in 1887.

BAN'NEKER, BENJAMIN (1731-1806). A negro mathematician. He was a native of Maryland and was a protégé of Thomas Jefferson. His grandmother, an Englishwoman, taught him to read and write; and after his fiftieth year he began to study mathematics with special reference to astronomy. In 1792 he issued an almanac of his own making and continued the series annually throughout his life. He assisted in fixing the boundary lines of the District of Columbia and in laying out the city of Washington. For his biography, consult Latrobe (Philadelphia, 1848), and Morris (Baltimore, 1854).

BAN'NER (OF. banere, banerc, Fr. bannière, bandière, LL. baneria, banderia, from bandum, standard; cf. Goth. bandica, sign, token, OHG. bant, band). Strictly, a kind of flag painted or embroidered with arms, and of a size proportioned to the rank of its bearer; often fringed with the principal metal and color of the arms. The chief distinction between banners and other flags, such as standards, pennons, etc., is that the former is square, or nearly so, while the others are, as a rule, elongated. See ENSIGN; FLAG; STANDARD.

BAN'NERET (OF. baneret, banneret, from banerc, banner). A knight entitled to display a banner, as distinguished from a pennon. The honor was originally gained in feudal times by bringing a certain number of soldiers into the field, but later became the reward of heroic acts performed in the face of the enemy. The first

banneret in England, according to Froissart, was made by King Edward I, and the last by Charles I, after the battle of Edgehill, the recipient being John Smith, who had recovered the royal standard from the insurgents. There are three doubtful instances, however, of the bestowal of this honor in the eighteenth century. At the creation of a knight banneret the king, or his general at the head of his army drawn up under the royal banner in battle array after a victory, attended by all the officers and nobility of the court, received the banneret-elect, not necessarily a knight previously, led between two knights of note or other men famous in arms, carrying his pennon in his hand, the heralds walking before him and proclaiming his valiant achievements for which he deserved to be made a knight banneret and to be privileged to display his banner in the field. The king, or general, would then say to him, "Advance, banneret!" and cut off the point of his pennon, thus altering its shape to that of a banner (q.v.). The new knight, with the trumpeters sounding before him and the nobility and officers bearing him company, would next be sent back to his tent, where a noble entertainment, provided by the king, awaited him.

BAN'NOCK (Gael. *bonnach*, *bannach*). A cake of home-made bread formerly common in the country parts of Scotland and in the north of England. It is usually composed of pease-meal or pease and barley meal mixed; prepared without any leaven, it is baked on a circular plate of iron called a girdle. When made of mixed meal, it is called a "mashlum bannock." "Bannocks of barley meal" form the theme of a popular Scottish song.

BANNOCK. See **BANAK**.

BAN'NOCKBURN (Gael. the stream of the white knoll; *burn*, AS. *burna*, a small stream; cf. Ger. *Brunnen*, well). A village in Scotland, about 2¼ miles southeast of Stirling, on the Bannock Rivulet, the scene of a great battle, fought on June 24, 1314, in which Robert Bruce, with 40,000 Scotch, gained a signal victory over Edward II with 60,000 English, and secured his throne and the independence of Scotland. The victory was due in great measure to the clever device of Bruce, who caused the ground in front of his position to be undermined in all directions. The English cavalry blundered into the hidden pits, were rendered helpless, and threw the rest of the army into confusion. The English are said to have lost 10,000, and the Scotch 4000, men. The "bore stone" on which Bruce is said to have fixed his standard on that day is still to be seen on an eminence near the scene of the fight. On the southeast of the field of Bannockburn, at Sauchie Burn, James III was defeated June 11, 1488, by his rebellious subjects, and assassinated after the battle at Beton's Mill, where he had taken refuge. See **SCOTLAND**.

BANNS (earlier also *bannes*, pl. of *ban*) **OF MARRIAGE.** The preliminary public announcement or proclamation constituting a part of the religious ceremonial of marriage. It was made compulsory throughout Christendom by a decree of Innocent III at the fourth Lateran Council of 1215 and is still employed, both in England and in most Roman Catholic countries, as an essential part of the religious celebration of matrimony. It is not necessary to the validity of marriage, however, which, in England and the United States at least, could always be effected by a civil contract without ceremony.

The object of this publication was to give notoriety to the act, so that all who had valid objections to the marriage might be enabled to state them in time. By the English Book of Common Prayer the announcement is required to be made in the terms of the rubric prefixed to the marriage service, on three Sundays preceding the ceremony. If any valid objections are offered, it is the duty of the clergyman to proceed no further with the marriage; if, notwithstanding, he marries the parties, he will be liable to severe penalties by the ecclesiastical law, though it does not subject him to the ordinary criminal law of the land. According to the old English Canon Law the publication of banns might be made on holy days; but a change was made to Sunday by the first important English Marriage Act, the 26 Geo. II, c. 33—a provision which is still in force.

The custom was continued in the early history of the English Colonies in America and of the States formed from them. It is now practically obsolete in the United States, except in the Roman Catholic church, although it is still recognized in the statutes of some of the States (Stimson, *American Statute Law*, sec. 6120). See **MARRIAGE**, and consult the authorities there referred to.

BANQUETTE, bān-ket' (Fr. dimin. of *banc*, bench). A projection or raised ledge forming a platform on the inner side of the parapet of a rampart and designed to accommodate and protect the rifle fire of the defenders. Its dimensions vary according to circumstances. See **FORTIFICATION**.

BANQUO, bān'kwō. According to Holinshed, who probably drew his information from Boece, a Scottish warrior of the eleventh century and the progenitor of the royal house of Stuart. In 1066 he is said to have joined Macbeth in a conspiracy against King Duncan and to have been treacherously slain by his confederate. Shakespeare does not mention him as a conspirator, but only as Macbeth's victim. Boswell-Stone (*Shakespeare's Holinshed*, New York, 1896) says "Banquo and Fleance were, I suppose, creatures of Boece's imagination."

BAN'SHEE, or **BEN'SHEE** (Gael. *ban-sith*; from *ban*, woman, + *sith*, Ir. *sighe*, fairy). An imaginary being in Irish and general Celtic folklore. The banshee is a female, called the wife of the fairies, who makes her presence known by wailings and shrieks, and thus gives warning of a death in the family, over which she is presumed to exercise a kind of guardianship. Not all Celtic families, however, enjoy this guardianship, which seems to be reserved for certain exclusive lines of descent.

BANSWARA, bān-swā'rā. A native state of Rajputana, India, in the west of Malwa, bordering on Gujerat (Map: India, B 4). It extends from lat. 23° 10' to 23° 48' N., and from long. 74° 2' to 74° 41' E. Area, 1606 square miles. Pop., 1891, 181,000; 1901, 165,300; 1911, 165,463.

BANTAM, bān-tām' or bān'tām. A seaport town in the western part of Java, situated in the residency of the same name on Bantam Bay (Map: East Indies, C 6). It was the capital of the kingdom of Bantam, which was a powerful state before the Dutch conquest. The town attained considerable commercial importance during the sixteenth and seventeenth centuries. Since the foundation of Batavia, Bantam has steadily declined, and only ruins of its former greatness remain.

BANTAM. A class of diminutive domestic fowls. See FOWL.

BANTAYAN, bân-tā'yân. A town on the island of the same name, belonging to the province of Cebu, Philippine Islands, situated 62 miles north of Cebu. Numerous shoals make navigation difficult. A leper colony inhabits a small island just off shore. Pop., 1903, 13,324.

BAN'TENG (native Malay name). An East Indian ox (*Bos sondaicus*), which inhabits southern Burma and the Malay Peninsula, Borneo, and Java, is by some considered only a local race of the gaur of India. It is smaller and of lighter build than the gaur, with a longer and sharper head, and the horns more slender and rounded; there is less of a dorsal ridge, and the cow is peculiar in being bright dun in color, while the bulls more nearly resemble gaurs. This wild ox inhabits the jungle and is exceedingly wary and pugnacious. It has been interbred with the zebu and other domestic cattle, yielding a serviceable hybrid, of which large herds are kept by the Malays of Java and Bali. Consult Wallace, *Malay Archipelago* (New York, 1869). See Plate of WILD CATTLE, under CATTLE.

BANTING SYSTEM. See OBESITY.

BANTOCK, GRANVILLE (1868-). An English composer and conductor. He was born in London, Aug. 7, 1868, and educated originally for the East India service. But his love of music caused him to change his plans. After a brief preparatory course under Dr. Saunders he entered the Royal Academy of Music in 1889, and there won the Macfarren Prize in his first year. From 1893 to 1896 he edited *The New Quarterly Musical Review*. He began his career as conductor in 1896, when he accepted a position with G. Edwardes's opera company. Concerts given by him in London in 1897 attracted attention from the fact that he brought out nothing but English compositions of the most recent date. In the same year he was appointed municipal director of music at New Brighton, where he established an orchestra and a choral society, which soon rose to a high level of excellence. In 1900 he became principal of the Birmingham and Midland Music School and in 1903 he added to educational duties those of conductor of the Liverpool Orchestral Association. In 1908 he became professor of music in Birmingham University. Bantock became known not only as one of the most energetic champions of modern English music, but also as one of the most prolific and distinguished composers of the day. After 1900 scarcely a year passed that a new work from his pen was not heard at one of the great English festivals. His principal works are the operas: *Cardmar* (1892), *The Pearl of Iran* (1896), and incidental music to his own five-act drama *Ramesses II* (1891); an oratorio, *Christ in the Wilderness* (1907); the symphonic poems: *Thalaba* (1900), *Dante* (1902), *Fifine at the Fair* (1902), *The Witch of Atlas* (1902), *Lalla Rookh* (1903), *Dante and Beatrice* (1911); the overtures: *The Fire Worshipers* (1892), *Eugene Aram* (1895), *Saul* (1907), *Overture to a Greek Tragedy* (1911); vocal works with orchestra: *Wulstan* (1892), *Thorvenda's Dream* (1903), *The Spirit of the Times* (1904), *Sea-Wanderers* (1905), *Omar Khayyam* (two parts, 1906 and 1907); a choral symphony, *Atalanta in Calydon* (1912); and an *A Cappella* mass in B flat for male voices, male and mixed choruses; several smaller compositions for orchestra; a string

quartet in C minor; Serenade for four horns; piano works and songs.

BANTRY (Ir. *Beantraighe*, descendants of Beann, of the royal race of Ulster). A seaport town and famous summer resort in the southwest of county Cork, Ireland, 44 miles west-northwest of Cork (Map: Ireland, B 5). It is at the head of Bantry Bay (q.v.), where in 1796 a French fleet anchored and an abortive attempt was made to land. The chief trade is the export of agricultural produce. Pop., 1901, 3109; 1911, 3159.

BANTRY BAY. An inlet of county Cork, in the southwest extremity of Ireland (Map: Ireland, B 5). It runs east-northeast, is 25 miles long, from 3 to 5 miles wide, affords safe anchorage for the largest ocean-going vessels, and is a naval rendezvous. The lighthouse on Ronacarrig Island at the east entrance of the bay has a fixed light which is visible 10 miles at sea. Consult Palliser, "Bantry Bay," in *United Service Magazine*, vol. xviii (London, 1898).

BANTU, bân'tōō (*Ba-ntu*, the people). A group of negroes of Central and South Africa, forming Class VI of Deniker (see AFRICA), in which they are divided into western, eastern, and southern. One language unites this people, which otherwise shows considerable diversity. More particularly, it is necessary to emphasize the fact that they do not constitute a single physical or racial type. They are capable and progressive, and great colonizers. With the exception of the Herero, who must be supposed to have lost the art, all the Bantu are tillers of the soil, the women everywhere attending to cultivation, while the men hunt and in many regions herd the stock. Maize has been introduced and has become the staple food in many territories, where the banana probably at one time held a similar position, as it still does in Uganda. In some districts millet is the most important food. A knowledge of smelting iron is shared by all the Bantu. Their clothing varies, including skin coverings, bark cloth, and loom-woven fabrics. Such arts as pottery, carving, and basketry flourish over wide areas. In a number of instances great nations have been founded by some conquering prince of exceptional ability, and in such cases there is a wonderful development of court offices and titles of nobility, recalling mediæval feudal conditions. However, these monarchies are rarely of long duration; with the decease of the founder they generally degenerate and are split up into smaller territories. For other cultural traits, such as religion, see AFRICA, *Ethnology*. The principal subdivisions of the Bantu are the following: Bakalai, Bakuba, Baluba, Balunda, Basuto, Bateke, Bechuanas, Bongo, Congo, Dualla, Fans, Herero, Lunda, Mpongwe, Nyoro, Ovampo, Rua, Sechuana, Swahili, and Zulu. Consult Deniker, *Races of Man* (London, 1900). On the languages Professor Meinhof is the leading authority.

BANUS. See BAN.

BANVILLE, bân'vel', THÉODORE FAULLAIN DE (1823-91). A French poet, born at Moulins. A pupil of Hugo in prosody and rhetoric, he was a follower of Gautier in his passionless objectivity and hedonistic ethics. The titles of his volumes of poetry suggest the impassive nature of the contents: *Cariatides* (1842); *Stalactites* (1846); *Odelettes* (1856); *Odes funambulesques* (1857); and *Nouvelles odes funambulesques* (1869). The Franco-German War stirred him to a more passionate utterance in *Idylles prus-*

siennes (1871). He wrote also two charming dramatic sketches, *Gringoire* (1866), a sort of defense of poetry against the materialistic spirit of the Napoleonic régime, and *Socrate et sa femme* (1885). His prose pieces are poetry in all but form, whether they call themselves 'Fairy Tales' (*Contes féeriques*) or 'Parisian Sketches' (*Esquisses parisiennes*, 1859). His critical *Traité de la poésie française* (1872) won him the title of "Legislator of Parnassus." But it is as a poet alone that he survives—a poet of a disillusioned age, a product of the determinist philosophy of Taine and the cynical materialism of the Empire. In form, as in ethics, he is a sensualist, reviving the artificial stanzas of the fourteenth century and in this becoming a forerunner of Austin Dobson (q.v.). In his *Odes funambulesques* his muse dances on the wire that he has stretched for her, with an easy assurance that evokes an amused admiration. It is the perfection of fanciful frivolity, inexhaustible in the flow of its empty gayety, "with the one idea of expressing no idea" (Lemaître), but producing the desired impression by artful interlinking of rhymes and harmonious or peculiar succession of sounds. Banville had a marvelous gift of musical speech that sings itself into the ear with a strange melody, or provokes a cynic laugh by its metallic iteration. Such art of poetry is ill-adapted to serious subjects. It closes its eyes deliberately to the sterner half of life and finds its natural element in pagan myths, renescent ideals, and Bohemian manners. Of such subjects he will paint exquisite pictures, cameos whose clear-cut outlines rival the brilliancy of their color. He is the most ingrained pagan among modern French poets. Banville's *Œuvres* are published in 8 vols. (1873-78), with a posthumous volume *Dernières poésies* (1893). His *Ballades* were translated into English verse by A. T. Strong (London, 1913). He died in Paris, March 13, 1891. Consult: Dowden, *A History of French Literature* (1897); Pellissier, *Le mouvement littéraire au XIX^{ème} siècle* (1901); the works on French literature by Faguet, Doumic, Lanson, Brunetière, Teller, Wells (1896), and the bibliography appended to the article FRENCH LITERATURE.

BANXRING, bānks'ring. A Javan tree shrew. See TREE SHREW.

BANYAN, bān'yan (Hind. *banya*, Beng. *baniya*, Skt. *vani*), merchant, as the tree is used by native merchants as a market place), also spelled BANIAN, *Ficus benghalensis*. A tree, native of India, growing to a height of 70 to 100 feet, remarkable for its vast prop roots. The banyan tree is extensively planted, but occurs in a wild state only in the lower Himalayas and the Deccan Hills. It is a species of fig (q.v.); has ovate, heart-shaped entire leaves, about 5 or 6 inches long; and produces a fruit of a rich scarlet color, not larger than a cherry, growing in pairs from the axils of the leaves. The branches send roots downward, which, when they have rooted, become props, the tree in this manner spreading over a great surface and enduring for many ages. A famous banyan tree exists in the Botanic Garden at Calcutta, India. This tree is known to be about a century old. Its main trunk is 40 feet in circumference, and there are 230 prop roots 6 to 10 feet in circumference. One has been described as having no fewer than 350 prop roots, equal to large oaks, and more than 3000 smaller ones, covering a space sufficient to contain 7000 persons. The

vegetation of the banyan seldom begins on the ground. The seeds are deposited by birds in the crowns of palms and send down roots which embrace and eventually kill the palm. As the banyan gets old, it breaks up into separate masses, the original trunk decaying, and the props becoming separate trunks of the different portions. The wood of the banyan is light, porous, and of no value. The bark is regarded by the Hindu physicians as a powerful tonic and is administered in diabetes. The white glutinous juice is used to relieve toothache, and as an application to the soles of the feet when inflamed. Birdlime is also made from it. Gum lac is obtained in abundance from the banyan tree. The banyan tree is beautifully described by Southey in his poem, "The Curse of Kehama." The banyan has been successfully conveyed to other lands, fine specimens being reported in Honolulu and elsewhere. The name "banyan tree" is often improperly applied to *Ficus indica*, a somewhat smaller tree. See PLATE of BAMBOO, BALSAM, ETC.

BANYULS-SUR-MER, bā'nyul'-sur-mâr' (Fr. little baths on the sea). A fishing port and summer resort on the Mediterranean, in the department of Pyrénées Orientales, France. It exports honey, oranges, and cork, and the famous Roussillon, Guenache, and Rancio wines, which are made in the neighborhood. Pop., 1901, 3111; 1906, 3301; 1911, 3216.

BANYUMAS, bān'yoo-mās', or **BANJUMAS** (golden water). A residency and a town of Java, situated on the south coast of the island (Map: East Indies, C 6). Area of residency, 2146 square miles. Its population was 1,251,963 in 1900, including about 1000 Europeans and about 5000 Chinese. The town and seat of the resident is situated on the river Serajo, about 22 miles inland. It has a considerable trade and contains a population of about 6500.

BANYUWANGY. See BANJUWANGY.

BANZ, bānts (Goth. *bansts*, inclosure). A castle, belonging to one of the Bavarian princes, originally a Benedictine abbey, in Upper Franconia, Bavaria, near Lichtenfels, on the Main; situated on a mountain slope over 1400 feet high. The abbey was founded in the eleventh century and celebrated for the superior culture of its monks. During the Peasants' War in the sixteenth century the abbey was destroyed but immediately restored, again destroyed in the Thirty Years' War, and again restored. In 1802 it was broken up, the books and collections were scattered among German institutions, and the building turned to its present use. The castle contains a number of beautiful rooms, and also a very rare and valuable collection of petrified objects.

BAOBAB (bā'ô-bāb) **TREE**. See ADANSONIA.

BAOUR-LORMIAN, bā'oor'lôr'myān', **PIERRE MARIE FRANÇOIS LOUIS** (1770-1854). A French poet and dramatic author, born at Toulouse. His plays were much praised at the time of their performance, and his translations of *Tasso* (1795) and *Ossian* (1801) attracted the favor of Napoleon. In 1815 he was made a member of the Academy; but the reign of the classic style was over, and protesting to the end with feeble dialogues, *Le classique et le romantique, encore un mot*, the poet found himself the butt of epigrams. Upon his death, however, the Academy paid him extraordinary honors.

BAPAUME, bā'-pôm'. The chief town of a

canton, in the department of Pas-de-Calais, France (Map: France, N., H 2). Pop., 1901, 3013; 1906, 2946; 1911, 2917. In August, 1793, a detachment of the allied troops advanced to this place, after compelling the French to abandon their fortified position and to retreat behind the Scarpe. The town was also the scene of one of the severest and most closely contested battles of the Franco-German War. It was fought Jan. 3, 1871, both sides claiming the victory. The Germans, however, were compelled to retreat beyond the Somme.

BAPH'OMET. The name of a mysterious symbol which was alleged to be in use among the Templars. According to the oldest and most probable interpretation, the word is a corruption of Mahomet, to whose faith the members of the order were accused of having a leaning. Indeed, the Old Spanish form is *Mafomat*. The symbol consisted of a small human figure cut out of stone, having two heads, male and female, with the rest of the body purely feminine. It was environed with serpents and astronomical attributes and furnished with inscriptions, for the most part in Arabic. Specimens are to be found in the archaeological collections of Vienna and Weimar and elsewhere. Joseph von Hammer-Purgstall, however, in the *Fundgruben des Orients* (Vienna, 1818), derives Baphomet from Gk. *βαφή*, *baphē*, baptism; and *μήτις*, *mētis*, council or wisdom. He charges the knights with depraved Gnosticism and makes the word signify the baptism of wisdom. But this explanation is generally discredited. Other explanations even less probable are offered.

BAPTAN'ODON (Gk. *βάπτειν*, *baptein*, to dip, here referring to amphibian habits + *δν*, *an*, priv. + *ὀδούς*, *odous*, tooth). The only American representative of the aquatic ichthyopterygian reptiles, and a late development of the Ichthyosaurus race. The animal was fish-like in general appearance, like all the Ichthyosaurians, and was provided with paddles that were shorter and broader than those of the other members of the group. The jaws were without teeth, and this leads to the supposition that the animal fed upon the succulent plants that grew in the vicinity of its dwelling place. It was about 10 feet long, and it lived during Middle Jurassic times in the shallow marine waters of the Colorado-Wyoming Basin. The name "Baptanodon beds," given by Professor Marsh to the series of rocks containing this fossil, has recently been replaced by "Shirley Formation." See *ICHTHYOSAURUS*.

BAPTISM (OF. *baptisme*, Gk. *βάπτισμα*, *baptisma*, from *βαπτίζω*, *baptizein*, to dip). One of the sacraments of the Christian Church, performed by applying water to the person of the candidate in various modes, in the name of the Trinity. Its institution is referred by the Gospels to Christ himself (Matt. xxviii. 19; Mark xvi. 16). Modern criticism has sometimes questioned the correctness of this reference, upon the ground that Christ did not concern himself with outward institutions; but there is no objective warrant for this rejection of the texts, and the immediate observance of baptism upon the beginning of the Church at Pentecost implies previous and well-understood establishment of the rite. The name and the rite were not, however, altogether new when the ordinance was instituted by Christ. The Jewish law introduced the custom of washing or baptizing proselytes upon their admission into the Jewish church.

John the Baptist baptized, not proselytes upon their renouncing heathenism, but those who by birth and descent were already members of the Jewish church, to indicate the necessity of a purification of the soul from sin—a spiritual and not a mere outward change. There has long been much controversy as to the proper subjects of baptism—whether adults only are to be baptized upon confession of their faith in Christ, or whether their infants are also to receive the ordinance. (See *BAPTISTS*; *BAPTISM, INFANT*.) The general practice of the Church, Greek, Roman, and Reformed, has been to baptize infants. Another controversy of long standing has been that as to the mode of baptism—whether immersion alone constitutes valid baptism, or whether other forms may be used. Those who favor immersion argue from the meaning of the word "baptize," from New Testament usage, from the symbolism of the doctrine, which they think has reference to the death, burial, and resurrection of Christ (Rom. vi. 3, 4), and from the acknowledged custom of the ancient and Oriental Church. Their opponents deny that the word "baptize" is exactly and solely equivalent in the New Testament to the word "immerse," dispute the definiteness of the testimony to the forms there referred to, restrict the symbolism to that of cleansing, and deny the whole cogency of the argument that apostolic example is, and was intended to be, binding upon the Church in purely formal matters. See *BAPTISTS*.

In the primitive Church the ordinary mode of baptism was by immersion, for which purpose *baptisteries* (see *BAPTISTERY*) began to be erected in the third, perhaps in the second century, and the sexes were usually baptized apart. But baptism was administered to sick persons by sprinkling; although doubts as to the complete efficacy of this *clinal* (sick) baptism were evidently prevalent in the time of Cyprian (middle of the third century). Baptism by sprinkling gradually became more prevalent; but the dispute concerning the mode of baptism became one of the irreconcilable differences between the Eastern and Western churches—the former generally adhering to the practice of immersion, whilst the latter adopted mere pouring of water on the head or sprinkling on the face, which practice has generally prevailed since the thirteenth century, but not universally, for it was the ordinary practice in England before the Reformation to immerse infants, and the *fonts* (see *FONT*) in the churches were made large enough for this purpose. This continued also to be the practice till the reign of Elizabeth; and the change which then took place is ascribed to the English divines who had sought refuge in Geneva, and other places on the Continent, during the reign of Mary. To this day the rubric of the Church of England requires, that if the godfathers and godmothers "shall certify him that the child may well endure it," the officiating priest "shall dip it in the water discreetly and warily"; and it is only "if they shall certify that the child is weak," that "it shall suffice to pour water upon it," which, however, or sprinkling, is now the ordinary practice.

Baptism was accompanied, from an early period in the history of the Church, with various forms and ceremonies, besides the simple rite of washing with water, and the pronouncing of the formula which declares it to be "in the name of the Father, and of the Son, and of the Holy

Ghost." These ceremonies are almost all retained in the Church of Rome, and also generally in the Oriental churches, but have been generally or almost entirely laid aside by Protestants. The Church of England retains the sign of the Cross made upon the forehead after baptism, but most of the other Protestant churches reject it. It was an ancient custom that the *catechumens*, as candidates for baptism were called while receiving instruction with a view to that sacrament, when they were to be baptized, publicly made a profession of their faith and a renunciation of the devil and all his works. The profession of faith is still retained by Protestant churches as the formal ground of the administration of baptism; the renunciation of the devil and his works is required by the Church of England of the person baptized, if an adult, or of the *sponsors* (q.v.) or "sureties" of a child. Sponsors were early admitted to answer for those who could not answer for themselves, and particularly for infants. The belief in the absolute necessity of baptism to salvation led even to baptism of the dead among the Montanists in Africa, in which sponsorship was also introduced. Presbyterian and Independent churches generally reject all sponsorship, and regard the profession made by parents as simply a profession of their own faith, which entitles their infants to baptism. The ancient practice of exorcism (q.v.) immediately before baptism has been rejected as superstitious by almost all Protestant churches; as have also that of immersing three times (*trine immersion*), or sprinkling three times, with reference to the three persons of the Godhead; that of breathing upon the baptized person, to signify the expulsion of the devil and to symbolize the gift of the Holy Spirit; that of anointing with oil (*chrism*, q.v.) to symbolize the same gift, or to indicate that the baptized person is ready, as a wrestler in the ancient games, to fight the good fight of faith; that of giving him milk and honey, in token of his spiritual youth and of his reception of spiritual gifts and graces; that of putting a little salt into his mouth, to signify the wisdom and taste for heavenly things proper to a Christian; that of touching his nostrils and ears with spittle, to signify that his ears are to be ever open to truth, and that he should ever feel the sweet odor of truth and virtue; and that of clothing him after baptism with a white robe (the *chrysom*), in token of the innocence of soul which by baptism he was supposed to have acquired. The white robe and the anointing with oil were retained in the Church of England for a short time after the Reformation. The giving of a name in baptism, however, is no essential part of the rite, but is a custom apparently derived from that of the Jews in circumcision (Luke i. 59-63). The Church of Rome prefers the use of holy water (q.v.) in baptism, but regards any water as fit for the purpose in case of necessity. Whether baptism may be administered in private has been much debated, both in ancient and modern times. The administration of baptism in private houses, and not in the presence of a congregation, was objected to by the Presbyterians in Scotland, and is discouraged, even while it is allowed, if there is "great cause and necessity," by the Church of England; yet it has become very frequent both in the Church of England and among the Presbyterians of Scotland, and also is not uncommon in the United States.

Although the administration of baptism is

properly restricted, under ordinary circumstances, to the regular ministry of the Church, even the most rigid sacerdotal communions, like the Roman Catholic, have always held that in cases of necessity it might be administered by any one—a woman or an unbeliever. The reason of this apparent laxity is the belief in the necessity of the ordinance to salvation. Protestant churches, which do not hold this belief, generally insist upon the participation of the ordained ministry in the ceremony. But all Christians now generally hold the validity of any baptism which is seriously done in the name of the Holy Trinity.

The effect of baptism is taught by the Roman Catholic church to consist in the forgiveness of all sins before baptism and the removal of the guilt of original sin. (See SACRAMENT.) Some Protestant churches teach, or favor, this doctrine of baptismal regeneration. (See REGENERATION.) But the great body of the Reformed Protestant churches teach that baptism is a sign of the necessity of regenerating grace, a pledge upon the part of God to forgive the sins of the penitent, and an act of consecration and dedication upon the part of parents, and of profession of faith on the part of adults. It thus is the sign of something effected rather than the instrument for effecting anything.

(London, 1907).

BAPTISM, INFANT. The New Testament is silent upon this subject. The biblical argument in its favor is confessedly inferential. It is based on the fact that the Old Testament covenant included children with their parents, and infers that the New Testament covenant does the same, and that baptism takes the place of circumcision as the covenant seal. Equally inferential is the argument against it. This starts from the proposition that baptism is a profession of faith (Acts ii. 38), and, since faith is impossible to infants, denies the appropriateness of their baptism. Irenæus in the early Church gives explicit testimony to infant baptism, as does a letter of St. Cyprian and 64 bishops in council assembled. By the time of Tertullian it was evidently in general use.

The development of infant baptism in the Church is closely connected with the development of the idea of the necessity of baptism to salvation. The second century generally ascribed three effects to baptism: forgiveness of all previous sins, communication of the Holy Spirit, and the impartation of a living power carrying immortality with it. The tendency was to ascribe this efficiency to the baptism as an external transaction. Faith was not forgotten, but was left unadjusted to this really inconsistent premise. Hence the argument went unhindered forward to the assertion of baptismal regeneration. But if regeneration was effected by baptism, baptism is necessary to salvation. And hence infants, so many of whom die in infancy, must be baptized if they are to be saved. The entire

Christian Church was soon united upon this reasoning.

Two tendencies were soon marked. The Greek church emphasized more the effect of baptism upon the future, the impartation to the child of the gift of immortality, and the implanting in him of spiritual power. The Latin church looked back rather upon the past, and hence baptism was held to effect the forgiveness of original sin.

The turning point in the history of the subject was made by the teachings of Augustine. While there are two distinct periods in his doctrine, he is steadily more and more influenced by his doctrine of the Church. Membership in the visible Church is viewed by him as necessary to the reception of grace and so to salvation. Therefore baptism, as the door of the Church, is necessary to salvation. It is the sacrament of regeneration. At first Augustine taught that only actual sins were forgiven in baptism, but later he said that the guilt of original sin was also forgiven. Conversion, however, is necessary as well as baptism, and in his earlier treatises there is a degree of liberality in asserting the saving power of the former where the latter was involuntarily omitted. Later the necessity of baptism was more uncompromisingly asserted. Children must therefore be baptized, and in their case regeneration is wrought in baptism by the faith of the whole Church. While unbaptized children do not gain eternal bliss, they suffer no punishment.

At the Reformation the effort was made to extricate the doctrine from the externalism which had become fixed and intensified in the Roman church and to give a due place to the idea of faith. Luther held that faith was wrought in children; Melancthon, that faith must come later to perfect the sacrament. The Anabaptists, who sought the most radical reform of the Church upon the basis of the New Testament alone, rejected infant baptism as not mentioned in Scripture and inconsistent with the requirement of faith. The same view of the subject arose among the radical element of the English Reformation, the Congregationalists, who divided in Holland upon this issue. Some of them, returning in 1611, formed the first Baptist church in London. (See BAPTISTS.) The large extension of the Baptists in the United States and their constant exposition of their position against infant baptism has led to a considerable neglect of it in denominations that still maintain and generally practice it. The necessity of baptism to salvation is now maintained only by the Roman Catholic church and by the sacramentarian party of the Lutheran and English churches.

BAPTIST CHURCH OF CHRIST. See BAPTISTS.

BAPTISTERY (Gk. *βαπτιστήριον*, *baptistērion*, bathing place). A place where baptism is administered. A term used to designate a separate building, or the annex or part of the church used for that purpose, or even the baptismal font. In the Apostolic Age, it is true, converts were usually baptized in the nearest running water, and this remained permissible for a long time—as in Charlemagne's wholesale baptism of the Saxons and in most early missionary work. But

as early as the second century Christian ritual required a separate building, provided with a basin or tank for immersion, and attached to an episcopal church, for baptism was connected with the abjuration of error and the hearing of mass. Baptisteries were of a well-defined form; their prototypes are the *frigidarium* in some of the smaller and private Roman baths, as at Pompeii and Stabiae, which were circular rooms with a *piscina* or *baptisterium* in the centre; this central tank, also called *piscina* by Christian writers, was usually octagonal in form in the baptisteries and entered by a descent of several steps (usually three) from the floor level. The earliest baptisteries preserved are in the Roman Catacombs (q.v.), supplied by natural springs, and these were used during the persecutions: the best known is that of the Catacomb of Pontianus (third century). In the fourth century, beginning with Constantine, many large baptisteries were erected. As they were not allowed except in connection with a cathedral church, and as the rite of baptism was administered ordinarily only at certain seasons—Easter, Pentecost, and Epiphany—the baptisteries had to be so large that several thousand persons might be baptized on each occasion. These baptisteries, usually circular or polygonal in plan, rarely cruciform, were placed close to the church and connected with it, sometimes in front of the atrium, either on its central axis (Parenzo), or to one side (Torcello). The main hall, with the *piscina* or *fons* in its centre, was usually preceded by a closed *portico* (Aquilaia, Lateran), where the ceremony of the Confession of Faith took place, and contained an altar, often placed in a special apse, for services to follow the baptism. The baptistery was, therefore, a church. It was commonly dedicated to St. John the Baptist. The baptismal basin itself was surrounded by columns, between which hangings were drawn which concealed from the crowd the actual scene of baptism. Above this central section usually rose a dome of masonry or wood, while around it was often an encircling aisle—sometimes two aisles—to accommodate the crowd. Early writers describe the magnificent decorations and furnishings of the baptisteries. That of St. John Lateran is said to be by Constantine, and is certainly not much later. It is an octagon, with an interior 69 feet wide, divided by eight columns into a centre and an ambulatory which is unique in being surmounted by a gallery. But in more unchanged condition is the contemporary (c.420) baptistery of the cathedral of Ravenna, an octagon inscribed in a square, whose walls and dome are completely covered with a wonderful decoration of mosaics, stuccoes, and marble slabs—one of the most perfect specimens of Early Christian art. Somewhat later the Arian heretics built a smaller baptistery for themselves (c.500) in Ravenna, on a similar plan. Several ruined baptisteries have been found connected with the interesting churches of the ruined cities of Syria, all of them of the fourth, fifth, and sixth centuries. That at Kalat-Seman is unique, not only in its four porticoes and four chambers symmetrically grouped around it, but in being set beside a small baptismal church, of basilical form. Of circular baptisteries, the most important is that at Nocera (fifth century) in southern Italy, measuring 70 feet inner diameter, with a peculiar brick dome supported on 15 pairs of coupled columns and surrounded by a vaulted aisle. The *piscina* at Nocera is unusually well preserved;

it is 20 feet wide and 5 feet deep, with two descending steps, a parapet with marble slabs, and eight surrounding columns for the hangings. The church of Santa Costanza, in Rome, similar to this and by many still regarded as a baptistery, was really the mausoleum of Constantia, the daughter of Constantine. Other interesting early examples are at Aquileia, Derseta and Moudjeleia in Syria, Albenga, Gravedona, and Sant' Aquilino, at Milan. Italy and the Orient alone have such early examples; among them the sixth-century baptistery of Hagia Sophia (St. Sophia) at Constantinople is still extant as an adjunct of the mosque. The period of decline from the seventh to the tenth centuries shows few of any importance. France has two examples at Fréjus and Poitiers. In the eleventh century the revival of architecture in Europe led to the building of superb baptisteries in Italy, but not elsewhere. Every free Italian commune had in its main square the group of three great religious structures—cathedral, tower, baptistery. The three most impressive of these groups are at Parma, Pisa, and Florence; others are at Pistoja, Novara, Cremona, Verona, Lucca, Volterra, and Siena. In the last named, the three are incorporated in one structure, the baptistery being set under the choir, owing to the steepness of the hill on which the cathedral stands. Its façade is one of the most perfect examples of Italian Gothic design. A superb Renaissance font rises from the centre of the octagonal base, which recalls the earlier piscina. Baptistries of the mediæval period—eleventh, twelfth, and thirteenth centuries—are especially numerous in northern Italy; besides the above, there are others at Almenso, Casale, Monferrato, Bologna (San Stefano), Ascoli, Serravalle, Asti, and many more, while the south is represented only by Ruvo and Bari. Of all these baptisteries, that of Florence is the most noted for its internal decoration in mosaic and for its fine dome, its marble-figured pavement, and its wonderful bronze doors by Andrea Pisano and Ghiberti. That of Pisa contains Niccola Pisano's famous pulpit. The Parma baptistery is entirely filled with contemporary frescoes and sculptures. All three are exquisitely finished on the exterior with different colored marble incrustations, architectural details, and sculptures. In some cases the dome that surmounts the baptistery is allowed to show its outline on the exterior (Pisa); in other cases a straight wall is continued from the base of the dome to a height that entirely conceals it (Parma); or, as at Florence, to an intermediate height, to support a low pyramidal roof. The largest of these mediæval baptisteries far surpass the earlier examples in size and could hold large congregations. Besides such separate structures, there were cases where a part of the church itself was used for baptism, either in the form of a projecting chapel or of one forming a part of the regular plan. Such chapels were usually near the entrance, opening either on the narthex (q.v.) or on the interior. Such is the baptismal chapel opening out of the inner right-hand narthex at St. Mark's, Venice.

Before the Renaissance, however, the change in ritual from immersion to affusion and aspersion only made separate buildings unnecessary. The simpler rite could be performed in the church itself, and all that was required was a large holy-water vase. Renaissance artists executed many exquisite works of this sort during the fifteenth and sixteenth centuries. These works

had been preceded by large sculptured immersion basins, as at San Frediano, Lucca, which had succeeded the simpler early tanks. In northern and western Europe no separate baptisteries seem to have been erected during the Middle Ages, except possibly in some of the French monasteries, though of these there are few if any traces extant. The general practice, even as early as the tenth century, was to set up a baptismal font in the north transept or in a chapel, and in England especially many of the mediæval fonts are still extant, often of great beauty. See BAPTISM; FONT; PLATE OF PISA.

BAPTISTS (Gk. *βαπτίζω*, *baptizein*, to dip in water, baptize). A name first given in 1644 to certain congregations of English Separatists, who had recently restored the ancient practice of immersion. These congregations were the first in modern times to maintain that immersion is essential to valid baptism; other bodies had practiced immersion, but without such teaching. The prominence assumed by the doctrine of baptism among the Baptists was due to the opposition of the other English churches to their practice. Immersion was denounced as new-fangled, unnecessary, immodest, dangerous to health, etc. Naturally Baptists retorted that immersion was indispensable. When the continental Anabaptists had practiced immersion, no one had opposed their practice vehemently, and they were not tempted therefore to give special emphasis to its necessity. In general characteristics of doctrine and polity the English Baptists were agreed with the more sober and evangelical groups of Anabaptists and with the Mennonites. They held that loyalty to Christ and His teachings is the supreme duty of Christians; that these teachings are contained in the Scriptures, which are thus the sole and authoritative rule of faith and practice; that the religion of Christ is spiritual, and none can enter the kingdom of heaven, or should enter the Church on earth, unless he has been born anew of the Spirit of God; that only those should be baptized, therefore, who make personal profession of faith in Christ and give credible evidence of regeneration; that a true Christian church is the fellowship of such baptized believers; that each church has Christ as sole Head and Lawgiver; that no secular power should interfere with the spiritual interests of any believer or of any church. These tenets are not accidentally associated, but constitute a logically compact series, each member of which is necessary to the full validity of the rest. All Baptist churches have been and are agreed in holding them, whatever their differences on other points.

From the first there were two main bodies among the English Baptists, distinguished by their adoption of the theology of Arminius or of Calvin. The Arminian or General Baptists originated first. About 1606 a congregation of Separatists at Gainsborough fled to Holland to escape persecution and established themselves at Amsterdam. Their leader, John Smyth, had been a clergyman of the Church of England; now his contact with the followers of Arminius and with the Mennonites led him to the adoption of many new opinions. He became convinced that infant baptism is not warranted by the Scriptures, and he therefore baptized himself, no doubt by affusion. Several of his followers joined him, and a new church was organized, practicing the baptism of believers only. Smyth soon withdrew from the church, but others held to their faith,

and, returning to England in 1611, established the first General Baptist church in London. By 1626 there were 5 such churches in England, and by 1644 they had increased to 47.

The Calvinistic or Particular Baptists sprang from a congregation of Separatists, established in London in 1616. In 1633 some members of this congregation, who opposed the baptism of infants, peaceably separated from the main body, a part of them receiving a new baptism; and soon afterward John Spilsbury became the pastor of this new congregation. In 1640 a further division in the original church occurred by mutual consent, and some of those composing one of the new congregations soon became convinced that immersion is the true scriptural baptism. Knowing none in England who practiced such baptism, they sent one of their number, Richard Blount, to Holland. There was at Rynsburg a Collegiant Church of Mennonites, who had adopted immersion in 1619 (probably having received it from the Polish Anabaptists, who had possibly derived their practice from some of the Swiss Anabaptists). Having been baptized by them, Blount returned to England, and began the administration of the new baptism in 1641. The Spilsbury people seem to have disliked this method, which they considered a vain search after a baptismal "succession," and about the same time adopted the practice of immersion *de novo*. As their pastor pithily remarked, "Where there is a beginning, some must be first." In 1644 seven churches of the Calvinistic order united in a Confession of Faith, being joined also by one French congregation, in which baptism was for the first time defined as "dipping" or "plunging." The General Baptist churches gradually adopted the same practice, though some of them continued the use of affusion as late as 1653.

During the period of the Civil War and the Commonwealth the Baptist churches received a practically full toleration and increased with great rapidity. This was especially true of the Particular Baptists, who were in closest sympathy with the Puritan movement. At the time of the Restoration (1660), the General Baptists claimed to have 20,000 members, whence it may be fairly estimated that there were fully 50,000 Baptists in all at that time. The services of these churches to the cause of English liberty, civil and religious, were heartily recognized. Several of Cromwell's highest officers were Baptists; some of the most popular preachers of the time were of the same faith; others, like John Milton, avowed Baptist sentiments, but never were connected with the churches. A few so far forgot their principles as to accept livings in the Established Church, and were even members of Cromwell's Triers, or commission of visitation for the setting in order of the parishes. The great majority, however, remained faithful to their contention, from the first, that the Church as a spiritual body should be entirely separate from the state, and that complete religious liberty should be given to all, even to Roman Catholics and Jews. It required two centuries for England to approximate the adoption of this Baptist programme. After the Restoration the Baptists were severely persecuted, the Conventicle and Five-Mile acts being strictly enforced against them. The well-known prolonged imprisonment of John Bunyan is the most conspicuous instance. Some proved more pliable than he and by promise of silence obtained their release;

some, like Hanserd Knollys, were in prison many times; others, like William Kiffen, enjoyed the royal favor and escaped with comparative immunity. Under these persecutions the Baptists declined in numbers, and the Revolution (1688) found them greatly depleted and discouraged. The Act of Toleration secured them from further persecution, but for a whole century thereafter their progress was very slow. A convention of the Particular Baptists, held in 1689, and representing over 100 churches, published what remained for generations their recognized standard of doctrine and practice. It was in the main a readoption of the Westminster Confession and differed from the Confession of 1644 chiefly in being silent on the question of baptism (immersion) before communion. Until the great Wesleyan revival, in the middle part of the eighteenth century, there was no further progress among the English Baptists. Among the Particular churches a form of hyper-Calvinism was common, which prohibited more than the preaching of the law to the unconverted and discouraged all direct appeals to men to accept Christ as their Saviour. The result was paralysis to most churches, and death to not a few. Among the General Baptists Socinian views made rapid progress, and in the end a large part of their churches became Unitarian. The Wesleyan revival greatly affected the Baptist churches. A more evangelical type of preaching was revived in both wings of the denomination. Under the leadership of Dan Taylor, a converted miner, the New Connection of General Baptists was organized and became a flourishing and influential body. But the most important result of this new quickening of spiritual life was the undertaking of work in foreign missions, under the leadership of William Carey. The English Baptist Missionary Society was organized Oct. 2, 1792, and the following year Carey was able to begin his labors in India. At his death, in 1834, not only had many converts been made, but versions of the Scriptures had been issued under his supervision in 40 different dialects, spoken by one-third of the people in the world; and 212,000 copies of these versions had been printed. The great increase of the modern missionary cause is directly traceable to the work of Carey and the English Baptists. The reflex influence of this missionary enterprise upon the English Baptists themselves is equally remarkable. More than 100 new churches were organized in the last two decades of the eighteenth century—nearly equaling the increase of the entire century preceding this time—while in the first half of the nineteenth century 700 new churches were constituted. The most important step in the unification of the English Baptists was the formation of the Baptist Union in 1832. Into this all the various societies for missionary and educational purposes have been merged; and, finally, in 1891, the long-separated General and Particular Baptists became one body. Of the men whom these churches have produced during the last 100 years three stand forth preëminent: Andrew Fuller (1754-1815), Robert Hall (1764-1831), and Charles Haddon Spurgeon (1834-92).

The first Baptist church in Wales of which record remains was formed at or near Swansea in 1649. The growth of Baptists in that principality was greatly promoted by the labors of Vavasor Powell, who was baptized about 1655 and thereafter preached throughout the land, establishing 22 churches, some of which had

several hundred members. The progress of Baptist churches in Wales was steady but slow until 1800. Of the 855 Welsh churches now in existence, 640 were founded in the nineteenth century. Until lately these churches have belonged to the strict communion wing; in recent years some of the city and town churches have adopted "open" principles.

The first Baptist church in Scotland was founded in Caithness in 1750, but progress was very slow until Archibald McLean and the Haldane brothers began their work as evangelists—the first quarter of the last century. Scotland is naturally Presbyterian, and the growth of Baptist churches has been very slow—an average of 10 to the decade for the last 100 years. Ireland has also been an unpromising field. The oldest church dates from 1653. Two-thirds of the existing churches have been established since 1850.

Baptists in America. There were among the early colonists those who held Baptist views, but the first church established was at Providence, R. I. Roger Williams, a minister of the Church of England, but an advanced Puritan, on coming to the Colony of Massachusetts, became almost at once a disturbing element there, by his advocacy of notions that the authorities of that Colony were not disposed to tolerate. He was condemned to banishment, Oct. 8, 1635, and, to escape being deported to England, made his way through the wilderness in midwinter, bought land of the Narragansett Indians, and founded the Colony of Providence, on the principle of complete civil and religious liberty. His study of the Scriptures convinced him that only believers are fit subjects of baptism, and others of the little Colony had come by March, 1639, to hold similar opinions. No minister being within call, this little band of 12 believers decided to originate baptism; one of their number, Ezekiel Hollman, baptized Williams, and he baptized the rest. In the following year, probably, another Baptist church was formed in the neighboring Colony of Newport. A company of Welsh Baptists emigrated in 1665 and established themselves in the Colony of Massachusetts, settling after some vicissitudes at Rehoboth in 1667. A Baptist church was formed in Boston in 1655, and in spite of severe persecutions succeeded in maintaining itself there. Until 1691 the Baptists of Massachusetts experienced repeated and severe persecutions—fines and imprisonments and whippings—and it was not until 1833 that they ceased to be taxed for the support of a State church. Up to the Great Awakening (1750) there were but eight Baptist churches in this region.

A group of churches, established a little later than these in the New England region, became the most influential centre for the propagation of Baptist ideas. In 1688 a Baptist church was formed at Pennepek, or lower Dublin, now a part of Philadelphia, and in the same year another church was organized at Middletown, N. J. Twelve such churches were in existence by 1770. The constituent members of these churches were English and Welsh Baptists, of the Calvinistic wing, and the establishment of the Philadelphia Association in 1707 made them the most compact and influential body of Baptists in America. Most of the churches of New York Colony, as they were constituted from 1712 onward, sought admission to this association, which also contained members in Virginia and the Carolinas, as far south as Charleston. The adoption

of a Confession before 1742, ever since known as the Philadelphia Confession, furnished a standard of doctrine that has endured to the present day and multiplied the influence of this association.

From these two centres the extension of Baptist churches slowly proceeded until the Great Awakening, when new life and vigor was infused into the movement, and the progress of Baptists in all the Colonies became relatively rapid. This progress was not seriously checked even by the Revolution, save in certain localities. There were probably no more than 10,000 members in the Baptist churches existing at the outbreak of that struggle; but a careful estimate made in 1792 (an enumeration, in large part) put the number of members at 35,000, and at the close of the century the Philadelphia Association stated the number at 100,000, distributed among 1200 churches. The great westward movement of the population after the Revolution was the opportunity of the Baptists, and they promptly improved it. The churches and associations on the borders of the new country sent missionary preachers into the new settlements, and gradually local societies were formed for this work. This led to the organization of State missionary conventions, and in 1832 to the formation of a national organization, the American Baptist Home Mission Society, which now sustains over 1500 workers at a cost of more than half a million dollars a year. In 1813 a society for foreign missions was formed, called "The General Convention of the Baptist Denomination in the United States," which continued to be the general agent of the churches for this work until 1845, when differences between the Northern and Southern churches concerning slavery produced a division. The Southern churches formed "The Southern Baptist Convention," which has continued until the present time to be their missionary agency; while the Northern churches organized "The American Baptist Missionary Union." The American Baptist Publication Society began merely as a tract society in 1824, but since 1840 has become a great denominational publishing agency.

The most important event in the recent history of Baptists was the unification of three separate interests through the formation in 1907 of the Northern Baptist Convention, a strictly delegated body from the churches, which elects the officers and executive boards of the various societies, receives and acts upon their reports, and prepares a national budget of missionary operations, which is apportioned to the various States and by their conventions is apportioned to the churches. This increases both the control of the churches over their missionary operations, and their responsibility for the maintenance of the work.

The progress of American Baptists during the nineteenth century was very rapid, in spite of many controversies and schisms that divided their forces and lessened their numbers. The most serious of these schisms was that resulting in the establishment of the Disciples as a separate body, beginning about 1815 among the churches of western Pennsylvania and Ohio. This controversy extended throughout the region of the Central West and had disastrous effects. Less serious was the division among the Eastern and Southern churches from 1835 onward on the issue whether missionary societies, Sunday schools, and other similar agencies for Christian work are authorized by the Scriptures. The es-

tablishment of the Old School or Primitive Baptists was the result. Aside from their rapid numerical progress, the educational work of American Baptists is the most striking feature of their history. This was begun in the academy at Hopewell, N. J., in 1756, and was suspended during the Revolution. The Philadelphia Association brought about the chartering of Brown University (as Rhode Island College) in 1764. Waterville (now Colby) College was founded in Maine in 1818, and a literary and theological institution (now Colgate University) at Hamilton, N. Y., in 1820. From this time on colleges and theological seminaries multiplied, at times in excess of denomination needs or ability to support them, until, in 1912, the Baptists were in possession of 10 theological schools, 97 schools of collegiate grade, and 91 academies. These schools possess property valued at over \$82,000,000, of which nearly half is productive endowment.

Baptist Theological Seminaries. In the order of their foundation these are as follows: 1. Hamilton, established at Hamilton, N. Y., in 1820, by the Baptist Education Society of the State of New York, as "The Hamilton Literary and Theological Institution." In 1846 the literary department was chartered as Madison University (since 1889 Colgate), and in 1893 the university took control of the seminary. 2. Newton Theological Institution, established at Newton Centre, Mass., in 1825, by the Massachusetts Baptist Education Society. 3. Rochester, established at Rochester, N. Y., in 1850, by the New York Baptist Union for Ministerial Education. A German department was added in 1852. 4. Southern, established at Greenville, S. C., in 1859; interrupted by the Civil War, the sessions were resumed in 1865, and in 1877 it was removed to Louisville, Ky. 5. The Divinity School of the University of Chicago, established in Chicago in 1867 by the Baptist Theological Union for the Northwest, as the "Baptist Union Theological Seminary"; in 1877 removed to Morgan Park, and in 1890 returned to Chicago and consolidated with the new university. In 1873 a Scandinavian department was added. 6. Richmond, established in 1867 at Richmond, Va., by the American Baptist Home Ministry for the education of negro young men (now a part of Virginia Union University). 7. Crozer, established at Upland, Pa., in 1868, by the family of John P. Crozer. 8. Kansas City, established at Kansas City, Kan., in 1901. 9. Southwestern, established at Waco, Tex., in 1901 as a part of Baylor University, but since removed to Fort Worth, Tex. 10. Pacific Coast, established at Berkeley, Cal., in 1905.

The Baptist Church in Other Countries. The earliest Baptist churches in the *Canadian* provinces were formed of settlers from New England. A church was founded at Horton, Nova Scotia, in 1763; but this and many of the earlier churches were of mixed membership, composed equally of Baptists and Congregationalists. The preaching of Henry Alleine, an evangelist of great gifts, resulted in the founding of many churches from 1775 onward. Baptist preachers from Vermont began soon after the Revolution to make converts and form churches across the line; and in a similar way churches sprang up along the shore of Lake Ontario, in Upper Canada. A considerable number of Scottish immigrants settled in the Ottawa region, and the churches there trace their origin to the labors

of the Haldane brothers. The first association was formed in 1800 by the churches of Nova Scotia and New Brunswick, and a missionary society was formed as early as 1815 in the same region. In 1846 the societies of this region were consolidated into "The Baptist Convention of the Maritime Provinces." In the other provinces a like consolidation was effected in 1888 by the formation of the "Baptist Convention of Ontario and Quebec." Five boards conduct the various branches of work that were formerly conducted by as many different societies. In proportion to their number and means Canadian Baptists have also been active in educational work. Acadia College was founded in 1838, and Woodstock College in 1857. Toronto Baptist College was founded in 1881, was affiliated with the University of Toronto in 1885, and was chartered as McMaster University in 1887, Moulton College, for young women, having been previously affiliated.

The Baptists in *France* owe their origin to a mission established in that country in 1832 by the Triennial Convention of American Baptists. Progress was slow for many years, owing to persecutions and other difficulties; but in later years growth has been steady and sure. The establishment of a theological school in 1879, by the aid of their American brethren, did much to promote the welfare of French Baptists, but it has proved impracticable to maintain it. For many years the work has been left wholly to native preachers.

The founder of the *German* Baptist churches, Johann Gerhard Oncken, had come by study of the Scriptures to such views of doctrine and practice as are everywhere held by Baptists, without any knowledge on his part that there were such people in existence. In 1834 he and six others were baptized at Hamburg by Rev. Barnas Sears, an American Baptist then pursuing studies in Germany, and so the first German Baptist church was established. In spite of severe persecutions the progress of this work was rapid almost from the first and has gone on with ever-accelerating momentum. A publishing house was started in 1828, and a theological school was opened in 1880; both have been and are flourishing institutions. In 1849 the associations previously existing were combined to form the "German Baptist Union," which, not content with fostering the work at home, has been an active missionary body. Germans have preached and gathered converts in Denmark, Finland, Poland, Holland, Switzerland, Russia, Hungary, Bulgaria, and Africa, until the numbers in these missionary churches equal those in Germany itself.

The work of Baptists was begun in *Sweden* by two sailors, natives of that country—Gustaf W. Schroeder, who was baptized in New York in 1844, and Frederick O. Nilsson, baptized at Hamburg by Oncken in 1847. Andreas Wiberg was a worthy third in this field. Opposition by the state church and repeated fines and imprisonments did not deter these preachers from carrying on their work, and the progress of the Baptist churches was rapid. The numerical results would be much larger but for the fact that a good proportion of the converts made have emigrated to the United States. A theological school established in 1866 has done much to further the work of the Swedish Baptists. From Sweden the work has extended into *Norway* also.

With one exception the Baptist churches of

Africa are of missionary origin. The Baptists of the Cape colonies owe their beginnings to English Baptist immigrants, and their earliest church was formed in 1820. For another half-century their progress was very slow; but the last two decades have seen a great advance, 18 of their 25 churches having been constituted since 1880. A missionary society sustains 4 mission stations among the natives, and a Baptist Union, formed in 1877, promotes the interests of all the churches. Mission work is carried on also by the American Baptist Missionary Union, the Baptist Missionary Society of England, the Southern Baptist Convention, and the German Baptists; and 125 churches have been established, with 14,786 members.

The Baptists in *Asia* are wholly of missionary origin. The oldest mission is that begun by Carey and the English Baptists in India proper, and since extended to Ceylon. The Australian Baptists have joined in this work, and have taken Eastern Bengal as their especial field. American and Canadian Baptists maintain missions in southern India, among the Telugu people. The oldest American mission, however, is that in Burma, and gradually the work has been extended to Assam, Siam, China, and Japan. The Southern Baptists have a mission also in western China. The Asiatic missions of the various Baptist societies have been the most fruitful in the history of modern missions.

The last century has produced considerable change in the doctrines and practices of Baptists, but most of these are such as they have shared with all other bodies. They are no longer rigid Calvinists, though the general type of theology is distinctly Calvinistic. Strict communion is yet the prevalent theory among them, but there is little enforcement of it in practice, except in the Southern States, though there is also little direct encouragement of "open" communion. Baptist churches have never had a heresy trial, and for more than 50 years a schism has been unknown among them. In polity they are Congregational.

Baptists began the twentieth century with over 5,000,000 communicants, including only what are sometimes called the "regular" Baptists. The membership in 1912 was distributed as follows: In the United States, 5,529,573; in Canada, 132,261; in the Latin-American countries, 11,113; in Great Britain, 416,377; in Europe, 166,310; in Asia, 163,278; in Africa, 10,176; in Australasia, 28,611. Altogether they number about 6,516,000. Increase during the decade 1890-1900 throughout the world, 1,220,000.

Baptist Church of Christ. A denomination that originated in Tennessee, where the oldest congregations were formed about 1808. They have spread to six other States, all of them in the South. Their belief is a modified Calvinism, which makes room for a general atonement; they practice feet washing as a religious ordinance. The church reports for 1905 gave them 152 churches and 8254 members.

Baptists, Freewill, correspond in doctrine and practice to the General Baptists of England, but originated in this country. There are two distinct bodies known by this name. The older arose in North Carolina and formed an association in 1729. Some of these afterward joined the regular Calvinistic churches of the region, and those who remained true to their first principles were popularly called "Freewillers." This nickname was finally accepted by them; but later, to distinguish themselves from others, they took the name "Original Freewill Baptists." They differ from the regular Baptist bodies mainly in practicing feet washing and anointing the sick with oil. In 1912 they had 834 churches and 57,231 members.

The better-known body arose in New Hampshire. Benjamin Randall, a convert of the Whitefield revival, was practically though not formally excluded from fellowship because he did not believe and preach the doctrine of election. A church believing in free grace was organized in New Durham, N. H., in 1780, and Randall was ordained to the ministry. The strength of the denomination has from the first been in New England, but it has made considerable progress in the Central West. In 1827 a general conference was formed, at first meeting biennially, but of late years triennially. In 1841 the Free Communion Baptists (a body that originated among the Separates, or churches that sprang up as a result of the Whitefield revivals) united with them. The Freewill Baptists bore emphatic testimony against slavery, especially in 1845, and declined overtures for union with certain Baptists of Kentucky, because the latter defended slavery. The Foreign Mission Society of the denomination was organized in 1833, and a home mission society in 1834. They sustain a college at Lewiston, Me.; Hilldale College, Mich.; theological seminaries at Lewiston, Me., and Hilldale, Mich., and several academies. The official name was changed some years ago to

Free Baptists, and the older name is going out of use. In 1906 the Free Baptists of the Maritime Provinces united with the other Baptists in a "United Baptist Convention." In 1910 the Free Baptists and regular Baptists of the United States arranged for the union and consolidation of their missionary societies, leaving further union to the local churches. The Free churches are still separately enumerated, to the number of 1110 in 1912, with 65,440 members. Consult Stewart, *History of the Freewill Baptists* (Dover, N. H., 1862); J. J. Butler, *Christian Theology* (1861).

Baptists, Old School or Primitive, also known as Anti-Mission, and popularly called "Hardshell." A denomination whose members claim to be the original Baptists, from whose principles and practices all others have departed. In fact, this body originated about 1835 in an organized opposition to missionary societies, Sunday schools, etc. This opposition really grew out of the hyper-Calvinistic theology held by some of the Baptist churches, and these human societies were held by them to make the salvation of men depend rather upon human effort than on divine grace. They do not believe in a paid or educated ministry and sustain no colleges or theological seminaries. They were at one time quite numerous in the Middle States, but are now strongest in the mountain districts of North Carolina, Tennessee, and Georgia. It is difficult to say whether they are increasing or diminishing, since adequate statistical information is not to be had. In 1912, according to the official reports, there were 2922 churches and 102,311 members.

Baptists, Seventh-Day, as their name indicates, are distinguished from others mainly by their observance of the seventh day instead of the first as the Christian day of worship. They hold that the literal observance of the Fourth Commandment has never lost its obligation and maintain that the early Christians observed the Sabbath. The first church of this order was founded in the Mill Yard, London, in 1676, by Rev. Francis Bampfield, a graduate of Oxford, and prebendary of Exeter Cathedral. This church still survives, but others founded in the seventeenth and eighteenth centuries have become extinct. The first American church had an independent origin, being founded by Stephen Mumford, at Newport, R. I., in 1671. In this country they have increased steadily though not rapidly, and are active in the propagation of their principles through tracts and books. In 1842 they formed a foreign missionary society, which has its headquarters at Westerly, R. I., and they support a tract and publishing house at Plainfield, N. J. They have a college at Alfred Centre, N. Y., and another at Milton, Wis., besides an academy at Salem, W. Va. For 1912 they report 96 churches and 8194 members, distributed through 24 States—a decrease of over 500 members in the last decade.

Literature.—J. Bailey, *History of the General Conference* (Toledo, Ohio, 1866); *Seventh-Day Baptist Memorial*; A. H. Lewis, *Sabbath and Sunday* (Alfred Centre, N. Y., 1886); and *A Critical History of Sunday Legislation* (1888).

Baptists, German Seventh-Day. A body confined to Pennsylvania, where it originated. The first church was founded at Germantown in 1728 by Conrad Beissel and was an offshoot of the Dunkards. Under the leadership of the founder they established a colony at Ephrata,

near Lancaster, where they lived a very austere community life. They spread to several of the adjacent counties, and there are now six congregations of this order. For the early history, see the *Chronicon Ephratense*.

Baptists, Six-Principle, originated as a separate body in 1690, when five London churches, dissatisfied with the Baptist Confession of the previous year, met and formed an assembly of their own, on the basis of the six principles enumerated in Heb. vi. 1-2: repentance, faith, baptism, laying on of hands, the resurrection of the dead, eternal life. In fact, they differed only on the question of laying hands immediately on all baptized persons. They were composed of both Calvinistic and Arminian Baptists, but the former withdrew after a time, and the remainder became absorbed into the General Baptists. Six-Principle Baptists existed in Rhode Island from the foundation of the first Baptist church in Providence, some of the founders having been of that persuasion. This church was divided on this issue in 1653, and the Calvinistic half became extinct. In 1771 the surviving Six-Principle wing, which until then had been Arminian in belief, was persuaded by Rev. James Manning, then its pastor as well as the president of Rhode Island College, to adopt a Calvinistic Confession. The churches of this order are confined to New England and are gradually becoming extinct. There are no statistics later than the census of 1890, which assigned them 18 churches and 937 members.

Baptists, United. The name taken on their union by Baptist churches in the South once known as "Old Lights," and "Separates" or "New Lights." The division arose in consequence of the Whitefield revival and was common to several denominations in the seaboard States. Most of the United Baptists came into full fellowship with other (regular) Baptists, with or without dropping the name; but in five Southern States they still maintain not only the name, but a separate organization. They had, in 1912, 196 churches and 13,698 members.

Baptists, Two-Seed-in-the-Spirit, a small body, extremely Calvinistic, owing their rise to certain theological vagaries of Elder Daniel Parker, a Baptist preacher of Tennessee from 1806 to 1836. It was sought to explain the doctrine of election by speculation of a Manichaean nature, the gist of which was that some of Eve's offspring were the seed of God and so elect to eternal life; while some, corrupted by Satan, were his seed and foreordained to the kingdom of eternal darkness. They incline toward Antinomianism, object to a paid ministry, and agree with the Primitive Baptists in reprobating "modern institutions." Their strength is in Kentucky, Arkansas, and Texas, though they are found also in 21 other States. In 1890 they had 473 churches and 12,851 members.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA. A society organized in Chicago in 1891. It has its headquarters in Chicago and publishes a monthly magazine, *Service*. It has a large membership throughout the United States and Canada. Consult Bacon and Northrop, *Young People's Societies* (New York, 1900).

BAR. A town in the government of Podolia, Russia, on a tributary of the Bug, 106 miles northeast of Kamenetz-Podolsk. Brick making, leather dressing, and distilling are some of its

most important industries, and a trade in grain is carried on. Eleven fairs are held annually. Pop., 1885, 13,434; 1897, 10,614. The "Confederacy of Bar," under the leadership of Krasinski and Pulaski, was formed here, Feb. 9, 1768, with the object of maintaining the independence of Poland and checking the growth of Russian influence.

BAR. In heraldry (q.v.), one of the charges known as *ordinaries*.

BAR. In hydrography, a bank or shoal formed by the deposition of sand and silt from water. Bars frequently occur at the mouth of a river where the outflowing water with suspended mud is checked in its motion by the sea, the coarser material thus having a chance to sink to the bottom. The sand along the bank of a river, carried to its mouth by the wind and the water, and the sand that is carried inward from the sea by the tidal waves, also contribute to the formation of bars. When the river cuts its way through the obstructing mass at its mouth, a delta may be formed. The decreased velocity of current in portions of a river channel gives rise to bars, which are subject to removals and rebuildings and are capable of causing continual shifting of the river channels. The Mississippi in America, the lower course of the Rhine in Europe, and the Hoang-ho in China present excellent examples of this phenomenon. Bars also form along seacoasts that are swept by tidal currents wherever there is sufficient decrease of velocity to allow a deposition of silt. They occur here as barriers, often of considerable extent, which are separated from the shore by lagoons of salt or brackish water. See HARBOR; DELTA; JETTY; RIVER.

BAR. In law, a term originally applied to the rail which separated the court officials from the suitors, their advocates and friends. When an action was brought to trial, the suitors presented themselves at the bar, accompanied by their advocates, who addressed the court from that position. Hence the secondary signification of the term, as denoting those whose profession it is to appear at the bar on behalf of suitors. The advocates or counsel attached to a certain judicial circuit or practicing their profession in a certain county or State are known collectively as the bar of such circuit, county, or State. The term is also employed in a looser sense to designate all the lawyers of a country, as "the American bar," "the English bar," etc. From the word, in this sense, comes "barrister" (q.v.). See also ADVOCATE; ATTORNEY.

Bar, Plea in. A plea or defense, which, if supported by evidence, forms a conclusive answer to an action, such as a traverse, or denial, of all the allegations upon which a civil action or criminal prosecution is based. See PLEA.

Bar, Trial at. Formerly a trial before all of the judges of a superior court in England, a practice long since discontinued.

Bar Associations are voluntary organizations or unions of lawyers, having for their primary object the elevation of the bar. Some of them are local and, to an extent, coöperative. Such is the Association of the Bar of the City of New York. Its active membership is limited to lawyers residing or practicing in the city of New York, and it maintains a fine law library and building for the use of its members. It was established, however, not simply as a social club, nor as a library association, but "to maintain the honor and dignity of the

profession of the law and to increase its usefulness in promoting the due administration of justice." There are also State bar associations, whose membership is limited to the lawyers of a particular State. On the other hand, to the American Bar Association any person is eligible who has been a member in good standing of the bar of any State for five years. See BAR ASSOCIATION, AMERICAN.

Bar Council. A body of elected barristers (q.v.) supported by the four Inns of Court (q.v.) as the voluntary representatives of the entire English bar, charged with the duty of dealing with all matters affecting the profession. They have no disciplinary authority, but they exercise a strong moral influence as guardians of professional etiquette and, in connection with the Attorney-General and benchers of the Four Inns, may secure the punishment of barristers who are guilty of misconduct.

BAR. In music, a vertical line drawn across the stave to divide a musical composition into portions of equal duration and to indicate the accent, which usually falls on the first note. Each of these small portions, called *Measures*, is also popularly termed a bar. The use of the bar dates from the fifteenth century. A double bar formed of two parallel vertical lines is always placed at the end of a composition or of a section thereof. Sometimes at the close of a section it is accompanied by dots, showing that a certain portion is to be played again. See MUSICAL NOTATION.

BAR, KARL LUDWIG VON (1836-1913). A German jurist, born at Hanover and educated at the universities of Göttingen and Berlin. He was professor at various times at Rostock, Breslau, and Göttingen. Both as a member of the Reichstag (1890-93) and in his capacity of jurist, he strongly advocated the introduction of publicity and of more humane procedure in criminal cases. He was made president of the Institute of International Law. His important works are: *Das internationale Privatrecht und Strafrecht* (1862; 2d ed., 2 vols., 1889, under the title *Theorie und Praxis des internationalen Privatrechts*); *Die Redefreiheit der Mitglieder gesetzgebender Versammlungen* (1868); *Die Lehre vom Kausalzusammenhang im Rechte* (1871); *Das deutsche Reichsgericht* (1875); *Staat und katholische Kirche in Preussen* (1883).

BARA, bā'rā, JULES (1835-1900). A Belgian statesman. He was born at Tournay and pursued the study of law in his native town, showing remarkable intellectual gifts and a fine power of oratory. Shortly after he had begun the practice of his profession he was summoned to be professor of law at the University of Brussels and presently established his reputation by a treatise on the relations of church and state, the *Essai sur les rapports de l'état et des religions au point de vue constitutionnel* (1859). He was chosen to the House of Deputies from Tournay in 1862 and affiliated himself with the Liberal party, then under the leadership of Frère-Orban. In the fierce conflicts between Liberals and Catholics Bara speedily obtained a reputation as one of the most effective debaters in the Chamber, and, upon the resignation of Tesch as Minister of Justice in 1865, he was appointed by the King to that position. In line with his extremely Liberal tendencies he attempted, in 1868, to bring about the abolition of capital punishment, but failed because of a

powerful opposition in the Senate; in the following year, however, he succeeded in effecting the abolition of imprisonment for debt. After the fall of the Frère-Orban cabinet in 1870 Bara reentered the Chamber of Deputies and by his great power of invective caused the resignation of the Clerical Ministry of D'Anethau in 1871 and helped to overthrow the Ministry of Malou in 1878. This was followed by the accession of the Liberals to power, and Bara became once more Minister of Justice under Frère-Orban, resigning in 1884 after the overwhelming defeat of the Liberals at the polls. From 1884 to 1894 he was leader of the Opposition in the Lower Chamber, but in the latter year failed of reelection, entering the Senate soon afterward. He died at Brussels, June 26, 1900.

BARABA-TATARE, bâ'râ-bâ-tâ'tâ-râ. A steppe in the governments of Tomsk and Tobolsk, West Siberia, between the rivers Irtysh and Ob (Map: Asia, G 3). It is a large stretch of low, flat, stoneless land, covered by salt lakes and marshes and traversed by a number of rivers. The lakes all appear to be in process of desiccation, which supports the opinion that the steppe was once the bed of a large lake. The soil is generally fertile, with extensive forests in the north, but the climate is unhealthy. The first Russian settlements were established about 1730.

BARAB'AS. The principal character in Marlowe's tragedy, *The Jew of Malta*, a monstrous creature who delighted in slaying others. He poisons nunneries and devises instruments of torture and death. By accident he himself meets the terrible death plotted for a victim. Shakespeare's Shylock is a humanized copy of the character. The rôle was created by Edward Allyn (q.v.).

BARAB'AS. The name of a prisoner whom Pilate released at the Passover when he condemned Jesus to death. It is the Greek form of *Bar abba*, 'son of the father,' or 'son of the master.' The oldest witnesses as to the text in Matt. xxvii. 16 f. read Jesus before Barabbas, and it is therefore probable that his proper name was Jesus—'son of the rabbi' being added as a distinction. Mark seems to have derived from an earlier source the information that he had been arrested as participant in an insurrection (xv. 6-15). His release may have been particularly gratifying to the people because he was the son of a rabbi. On the text consult especially Adelbert Merx, *Das Evangelium Matthæus*, pp. 400 ff. (c.1902).

BARABOO, bâ'râ-bû. A city and the county-seat of Sauk Co., Wis., 37 miles, by rail, northwest of the State capital, Madison; on the Baraboo River, and on the Chicago and Northwestern Railroad (Map: Wisconsin, D 5). It has a beautiful location, at an elevation of over 1000 feet, in a picturesque region, and is but 3 miles north of Devil's Lake. Two circuses make their winter headquarters here, and there are a historical museum and a library. The city is an important fruit market and has linen and woolen mills, a canning factory, iron mines, railroad shops, and creameries. Manufacturing interests are promoted by good water power. Settled in 1839, Baraboo was incorporated in 1882 and is governed by a mayor, elected biennially, and a municipal council. The water works are owned by the city. Pop., 1900, 5751; 1910, 6324.

BARABRA, bâ-râ'brâ, or **BER/BERINE** (Ar.). A mixed ethnic group. Nubian, Egypt-

ian, and Arab, living on the middle Nile, between the First and the Fourth Cataract. Cephalic index, 76. The Dongolese belong to this group.

BARACOA, bâ'râ-kô'â. A seaport town in the province of Santiago de Cuba, on the northeast coast of Cuba, about 90 miles east by north of the city of Santiago (Map: Cuba, L 6). It has a landlocked harbor and exports cocoa, bananas, and other tropical fruits. The industries include the making of oil from the coconut and the manufacture of chocolate. The first settlement of white men on the island of Cuba was made at Baracoa by Velasquez, or Don Diego Columbus, in 1511. This town was the capital of Cuba from 1518 to 1522. Near here Maceo and his handful of followers inaugurated, in February, 1895, the revolution which terminated in Cuban independence. Pop., 1899, 4937; 1907, 5633.

BARADA, bâ-râ'dâ. Supposed to be the Abana of the Bible, and called Chrysorrhoas by the Greeks. A river of Syria, which rises in Antilibanus and, flowing southeastward, passes through Damascus, where it is divided into several branches and empties into the marshy Meadow Lakes, 18 miles east of the city (Map: Palestine, E 1). Its waters are used extensively for the irrigation of the gardens of Damascus.

BARADAS, bâ'râ'dü', COUNT. A character in Bulwer's *Richelieu*, who conspires against the Cardinal. He is a favorite of Louis XIII, whom he also desires to slay. His plot to place the Duke of Orleans on the throne is discovered just as he is raised to the position of Prime Minister.

BARAGA, bâ'râ-gâ, FRIEDRICH (1797-1868). An Austrian Roman Catholic bishop and missionary. He was born in Carniola, Austria; came to this country in 1830, and spent the remainder of his life in the Chippewa and Ottawa missions in Michigan, becoming first Bishop of Marquette. He prepared a Chippewa grammar (1851) and dictionary (1851-53) and also wrote in Slovenian a work on the *History, Character, Manners, and Habits of the North American Indians* (1837), later translated into French and German, *Dužna Tašn*, a Slovenian prayer book, the tenth edition of which (1905) reached 84,000 copies.

BARAGUAY D'HILLIERS, bâ'râ'gâ'dé'yâ', ACHILLE (1795-1878). A French general, the son of Louis Baraguay d'Hilliers. He was born in Paris, entered the army, and was wounded at the battle of Leipzig, 1813. He served in Spain in 1823, obtained in 1832 the appointment of lieutenant governor in the military school of St. Cyr, where he suppressed a republican conspiracy, and made a number of campaigns in Algeria. After the Revolution of February, 1848, he was chosen a member of the National Assembly, in which he joined the party of reaction. In the beginning of November, 1849, he went to Rome as commander in chief of the French army sent to sustain the authority of the Pope. He returned in 1850 and in January, 1851, obtained the command of the Army of Paris, in the place of Changarnier. Baraguay d'Hilliers concurred in the policy of the coup d'état of December, 1851, and was made a member of the Consultative Commission. During the Crimean War he received the command of the French Expeditionary Corps of the Baltic and coöperated with the British fleet in the capture of Bomarsund. He was afterward made a marshal of France and took part in the Italian

War of 1859, distinguishing himself at Solferino. In 1871 he was made president of the court appointed to investigate the conduct of the generals who had surrendered fortresses during the war with Prussia.

BARAGUAY D'HILLIERS, Louis (1764-1813). A distinguished general of the French Empire. He was born in Paris and, after serving under Custine and Menou, received an appointment in the Army of Italy from Napoleon, serving in the campaigns of 1796-97. He was made a general of division and, after the preliminaries of Leoben, April 18, 1797, became commandant of Venice. He accompanied the expedition to Egypt and headed a division in the Russian campaign of 1812, but on the retreat he incurred the displeasure of Napoleon. He was sent as Governor to Berlin, where he died soon afterward.

BARANOFF, bà-râ'nôf, ALEXANDER ANDREY-EVITCH (1746-1819). The first Governor of Russian America. In 1796 he established a colony on Bering Strait; in 1799 took possession of the largest of the Sitka Islands (now Baranof Island, see below), began trade with the natives, and subsequently extended his operations to Canton, the Hawaiian Islands, Boston, New York, and other distant places. He founded a small colony in California, near the present San Francisco, but this was soon abandoned. He died at sea near Java, while on his return to Russia.

BARANOF (bâ-râ'nôf) **ISLAND**. The most important island of the Alexander Archipelago, off the southwest coast of Alaska (Map: Alaska, N 7). It is about 100 miles long and 25 miles broad in its widest part. Sitka (pop., 1910, 2210), once the capital of the Territory, is on the northwest coast of the island.

BARANTE, bâ-rânt', AMABLE GUILLAUME PROSPER BRUGIÈRE, BARON DE (1782-1866). A French statesman and historian. While yet young, he was employed in political missions in Germany, Poland, and Spain, and was prefect at Nantes at the time of Napoleon's return from Elba, when he at once resigned. On the Second Restoration he was made Councilor of State and Secretary-General to the Minister of the Interior and was elected to the Chamber of Deputies. In 1819 he was made a peer of France and took an active part in the debates of the Chamber. After the Revolution of 1830 he was sent as Ambassador to Turin and in 1835 filled the same position at St. Petersburg. He supported Louis Philippe and retired from public life on the fall of the monarchy in 1848. His great work is the *Histoire des ducs de Bourgogne* (1824; 8th ed. 1858), which procured for him membership in the Academy. Among his other works are *Histoire de la Convention nationale* (6 vols., 1851-53), *Histoire du Directoire* (1855), *Etudes historiques et biographiques* (1857), and *Etudes littéraires et historiques* (1858). Consult *Souvenirs du baron de Barante*, edited by his grandson (Paris, 1890-99).

BARASINGHA, bâr'â-sin'gâ. A swamp deer (*Cervus duvauceli*) of northern India—a native name adopted by sportsmen. See **SWAMP DEER**.

BAR ASSOCIATION, AMERICAN. An organization which includes in its membership nearly all the leading lawyers of the United States. It is composed of the State Bar Associations and was founded in 1878. The object of this organization is declared in its constitution to be "to advance the science of jurisprudence,

promote the administration of justice and uniformity of legislation throughout the Union, uphold the honor of the profession of the law, and encourage cordial intercourse among the members of the American Bar." Annual meetings are held in different cities for the purpose of discussing matters of interest to the profession. Committees of the association have been engaged for several years in the study of methods for the reform of judicial procedure, uniform divorce laws, and other reforms affecting the legal profession. The annual meeting held in August, 1913, at Montreal had for its chief guest Viscount Haldane, the British Lord Chancellor. At this meeting William H. Taft was elected president. The association has a membership of over 5000 and is exercising a powerful influence in many ways. It has done much to elevate the standard of legal education and to promote uniformity in State legislation upon various subjects.

BARATARIA, bâ'râ-tû-ré'a. A name, signifying 'deception,' given to an island which appears in fairy tales. In Cervantes' *Don Quixote* Sancho Panza is made Governor of Barataria, but resigns his honors in disgust over his experiences at the inaugural feast, when appetizing dishes are placed before him, but removed before he has a chance to eat.

BAR'ATA'RIA, **PIRATES OF**. In American history, a company of outlaws who established themselves in and near the Bay of Barataria, La., on the west side of the Mississippi Delta, about 40 miles south of New Orleans, whence they emerged to commit depredations on the shipping of England and Spain. Under the leadership of the notorious Jean Lafitte (q.v.), they rapidly increased in numbers and audacity and succeeded in capturing large quantities of booty, which they disposed of through their agents at New Orleans. Their colony was broken up in September, 1814, by Commander Daniel T. Patterson, of the United States navy. Subsequently Lafitte and a number of his men volunteered for the defense of New Orleans against the British and served with gallantry under Jackson in the battle of Jan. 8, 1815. Consult two articles on "Jean and Pierre Lafitte," by Charles Gayarré, in vol. x of *The Magazine of American History* (New York, 1885).

BAR'ATHRON. A deep gorge outside of Athens, originally a quarry, and artificially enlarged, into which criminals condemned to death were hurled. Here the messengers sent by Darius to demand symbols of submission from the Athenians were put to death.

BARATIERI, bâ'râ-tyâ'râ, ORESTE (1841-1901). An Italian general, born at Condino, in the Tirol. He fought under Garibaldi in Sicily in 1860 and after the war against Austria in 1866 joined the regular army. In 1891 he was made Governor of Eritrea, the new possession of Italy on the Abyssinian coast land, in Africa. In pursuance of the ambitious schemes of conquest entertained by the Italians, and in violation of a treaty concluded with the Negus Menelek in 1889, General Baratieri advanced into the highlands of the interior to the west and southwest of Massowah and after a long campaign captured Kassala, in July, 1894. Advancing thence into Tigré (q.v.), he twice defeated the *ras*, or prince, of that country in January, 1895. The conquests of the Italians finally drove Menelek to resistance; the latter's generals took the field with 100,000 men, and

Baratieri was forced to retreat from Adowa, the capital of Tigré, towards Adigrat. Fearing, however, to continue his retreat lest his forces should be thoroughly demoralized, he resolved to attack the Abyssinians, advanced once more on Adowa, and on the morning of March 1, 1896, joined battle on the heights near that place. So fierce was the onslaught of the Shouan forces of Menelek that the Italians were routed, with the loss of 250 officers, 7000 men, and all their artillery. General Baratieri was brought before a court-martial, which absolved him of criminal responsibility, but censured at the same time his conduct of the campaign. Baratieri left the army in the same year. In 1897 he published *Mémoire d'Africa* (1892-96), in the nature of a defense.

BARATINSKY, bā'rā-tīn'skā, YEVGENY ABRA-MOVITCH (1800-44). A Russian lyric poet and friend of Pushkin. He began writing at an early age, imitating the style of Pushkin and Byron most successfully. While serving as a soldier in Finland, he was impressed by the stern grandeur and picturesqueness of nature, and embodied these aspects in his poem *Eda* (1826), much admired by Pushkin. Generally, however, his poetry is of a most pessimistic character. His study of philosophy and the contemplation of the riddles of the universe had made him so disconsolate that even Pushkin lovingly called him "Hamlet Baratinsky"; and little of his writing, indeed, escaped the "pale cast of thought" that is associated with Shakespeare's Danish hero. Thus *Twilight*, a collection of his minor verse published in 1842, is steeped in melancholy. Finding himself at the parting of the ways, when the old school of Russian poets was about to be superseded, Baratinsky took a most gloomy view of Russian poetry itself. He even despaired of his art, seriously believing that the days of poetry were over. Hence *The Last Poet* elicited much adverse criticism, especially from Belinsky, the dean of contemporary literary critics, who wrote a very elaborate commentary on it. His best lyrical poems are *On the Death of Goethe*, *Finland*, *The Skull*, *The Last Death*, and *The Gypsy*, a popular poem picturing Russian high life. His complete works were published at Moscow (1827, 1835, and 1869; 4th ed., Kazan, 1884). Fiedler's *Russischer Parnass* (Dresden, 1889) contains several of his poems in German translation.

BARB (Fr. *barbe*, from *Barbarie*, Barbary). A distinct variety of the Arabian horse cultivated by the Moors of Barbary and introduced by them into Spain. Barbs are less remarkable for their beauty and symmetry than for their speed and endurance when stimulated by the excitement of a contest. The most celebrated barb to leave his mark upon the thoroughbreds of the world was the horse commonly known as the "Godolphin Barb," from the family name of his English owner, the Duke of Leeds (of the Godolphin family). Nearly every race horse of note on the English turf has a strain of the blood of this famous animal, who died in December, 1753, aged 29 years.

BARB (i.e., BARBARY), **PIGEON**, etc. See the substantives.

BAR/BACAN. See **BARRICAN**.

BARBACENA, bār'bā-sā'nā. A town in the state of Minas-Geraes, Brazil, about 125 miles north-northwest of Rio de Janeiro (Map: Brazil, J 8). It is situated about 3600 feet above sea level in the Sierra Mantiqueira, and the sur-

rounding district produces cane sugar, coffee, and grain. The town is a commercial centre, being the outlet for the product of mines in the district, but much of its importance has been lost with the development of transportation facilities. Barbacena is noted for its healthfulness and is a popular resort. Pop., about 6000.

BARBACENA, FELIBERTO CALDEIRA BRANT PONTES, MARQUIS OF (1772-1841). A Brazilian soldier and statesman, born near Mariana, in what is now the state of Minas-Geraes. In 1823 he was appointed envoy to Portugal to negotiate the recognition of Brazilian independence. He became a member of the Constitutional Assembly, and was elected life Senator in 1826. When in command in 1827 of the Brazilian forces in Uruguay, he was defeated at Ituzaingó. In 1828 he accompanied to Lisbon Maria II, the young Queen of Portugal, whose rights he very skillfully maintained. He was Brazilian Prime Minister in 1829-30.

BARBACO'AN. A South American Indian linguistic stock, occupying the region of 1° and 2° N. lat., in southwest Colombia and north-west Ecuador. The chief tribes are the Barba-coas, Colorados, and Cayapas. Regarding the relation of some of these Indians to such semi-civilized pre-Columbian peoples of the region as the Caras, etc., there is much difference of opinion. The Barbacoan stock is of interest from the fact that the famous name *Peru*, as Rivet points out, is probably derived from a word in one of its dialects, signifying 'river' or 'water.' These Indians and their languages have been studied recently by Seler (1886), Rivet (1896-1906, etc.), and Barrett (1909). Rivet seeks to make the Barbacoan a branch of the Chibchan stock. Consult Dr. P. Rivet's "Affinités des langues du sud de la Colombie et du nord de l'équateur" in *Muséon* (Louvain) for 1910.

BARBA'DOS, or **BARBADOES**, bār-bā'dōz (Portug. the bearded, from the bearded fig tree, *Ficus barbata*, found there in abundance). The most easterly of the West Indian islands, a possession of Great Britain, situated 78 miles east of St. Vincent, in lat. 13° 4' N. and long. 59° 37' W. (Map: West Indies, H 4). It has an area of 166 square miles. The surface, generally flat along the coast, which is surrounded by coral reefs, is elevated in the interior, where Mount Hillaby, the highest point, rises to about 1100 feet. Barbados has a healthful and, for a tropical island, a moderate climate, the mean temperature being about 80°. Earthquakes occur infrequently, but occasional hurricanes have caused great distress.

The soil is especially adapted to the cultivation of sugar cane, the staple product of the island. Of the 106,470 acres occupied by Barbados, about 100,000 acres are under cultivation, nearly one-third of which is devoted to sugar culture. Next in the rank of production come cotton, tobacco, coffee, indigo, and arrowroot. There are numerous sugar works and several rum distilleries, and the fishing interests are of importance. The imports of Barbados in 1911 were valued at £1,345,194 (\$6,537,643), and exports £1,088,830 (\$5,291,714). The principal articles exported were sugar, molasses, and rum; while the imports consisted largely of textiles, flour, rice, and fish. Manjak, a variety of bitumen, is exported to some extent.

The administration of the island is vested in a governor who is assisted by an executive committee, a legislative council of nine appointed members, and a house of assembly consisting

of 24 members, elected annually by popular vote. Education is under the direction of the government, which also subsidizes the various religious denominations represented on the island. Besides primary and secondary educational institutions, Barbados has Codrington College, which is in affiliation with Durham University, England. Barbados is the headquarters of the British troops in the West Indies. The island has 28 miles of railroad, 470 miles of roads, and 635 miles of telephone lines. The United States is represented by a consulate. The capital and principal port (the only harbor on the island) is Bridgetown (q.v.), which is also the see of a bishop of the Anglican church. The population of Barbados in 1891 was 182,306, and, in 1911, 171,892.

Barbados was first mentioned in the beginning of the sixteenth century and is supposed to have been visited by English seamen in 1605, but it was not colonized until 1625. After having been granted several times to different English noblemen, it was finally, in 1663, assumed by the crown. The continental wars of the eighteenth century were felt severely by Barbados, as the West Indies were the scene of important conflicts in the struggle between France and England. A period of prosperity succeeded the abolition of slavery in 1834. The riots of 1876, resulting from the proposed confederation of the Windward Islands, caused a considerable loss of life and property. Barbados has experienced several disastrous hurricanes, notably those of 1780 and of 1831, and, in more recent times, of 1898, all of which necessitated relief measures on the part of the Imperial government. (See BRITISH WEST INDIES.) Consult Stark, *History and Guide to Barbados* (Boston, 1893).

BARBADOS CHERRY. The name given in the West Indies to the fruit of two small trees or shrubs, *Malpighia urens* and *Malpighia glabra*, which are cultivated for its sake. Clusters of fruit are produced from the axils of the leaves. The fruit of *Malpighia urens* is small; that of *Malpighia glabra* is like a Mayduke cherry in size and appearance, but inferior in flavor. Each fruit contains a three or four angled stone. The leaves of *Malpighia urens* have stinging hairs on the under side.

BARBADOS GOOSEBERRY. (*Pereskia aculeata*). A plant not belonging to the gooseberry tribe, but to the cactus family. It is a native of the West Indies and tropical America. The fruit is pear or egg shaped, edible, but possesses expectorant properties. *Pereskia* plants are of value in that they furnish stocks upon which are grafted other kinds of cacti. *Pereskia aculeata* is chiefly used for this purpose, although *Pereskia bleo* is more vigorous and therefore better suited for use with tall stocks.

BARBADOS LEG. COCHIN-CHINA LEG. The common names of elephantiasis, a disease endemic in tropical and subtropical countries, and due to obstruction of the lymph channels by the *filaria sanguinis hominis*. See ELEPHANTIASIS.

BARBARA, SAINT. A saint of the Roman Catholic church, who, according to legends, suffered martyrdom at Nicomedia, in Bithynia, about 236, or, according to other accounts, at Heliopolis, in Egypt, about 306. She was of good birth, and well educated by her father, Dioscorus. To avoid disturbance in her studies he had a tower built for her, where she spent her youth in the deepest solitude. While in this retirement she was induced to embrace

Christianity. Her father, a fanatic heathen, learning his daughter's conversion and failing to induce her to renounce Christ, delivered her up to the governor, Martianus, to be dealt with by the law. Martianus, struck with the intelligence and beauty of the maiden, attempted first by arguments to make her relinquish Christianity and, when that failed, had recourse to the most exquisite tortures. At last the father offered himself to strike off his daughter's head. Scarcely was the deed done, when he was struck with lightning. Hence St. Barbara is to this day prayed to in storms. For the same reason she is the patron saint of artillery, and her image was at one time frequently placed on arsenals, powder magazines, etc. The powder room in a French ship of war is to this day called *Sainte-Barbe*. St. Barbara's day is December 4.

BARBARA ALLEN'S CRUELTY. One of the old ballads in Percy's *Reliques of Ancient English Poetry* (q.v.). When her lover, Jemmy Groves, lay on his deathbed, all Barbara Allen said to him was: "Young man, I think you're dying!" For this heartless composure she suffered great remorse.

BARBARA FRIETCHIE. A famous poem by John Greenleaf Whittier (1863), first published in the *Atlantic Monthly*. The poem is based on the report of a patriotic act of an aged woman in Frederick, Md., during the Civil War.

BARBAREA. See CRESS.

BARBARELLI, bär'bä-rèl'lè, GIORGIO. See GIORGIONE.

BARBARI, bär'bä-rè, JACOPO DE'. See JACOPO DEI BARRARI.

BARBARIAN (Gk. *βάρβαρος*, *barbaros*, non-Greek, barbarian). Among the Greeks, from the time of Homer, a designation for one who spoke a language other than Greek. This restricted signification prevailed until the Roman period. Plato, for example, divides the entire human race into Hellenes and Barbarians. The word is probably onomatopoeic in its origin, intended to represent a meaningless babble of sound, such as the Greeks conceived all foreign languages to be. It first began to acquire its secondary and invidious signification at the period of the Persian wars, when the Greeks, who always exhibited a proud consciousness of their superior intellect and privileges, employed the term to designate the character of their enemies. It then meant whatever was opposed to Greek civilization, freedom, intelligence, or morals; the Romans were naturally included by the Greeks under the general term, and Plautus, in his adaptations of the New Attic Comedy, uses *barbarus* humorously in the sense of 'Roman.' The adjective was not so used, however, by the Romans of themselves, but was employed by them to designate all peoples who differed from the Græco-Roman world in culture and language.

BARBAROSSA. See FREDERICK I.

BARBAROSSA, HORUK and KHAIR-ED-DIN. Two pirate chiefs, brothers. They were renegade Greeks, natives of Mitylene, and as Turkish corsairs were the terror of the Mediterranean during the first part of the sixteenth century. They made themselves masters of Algeria and Tunis and brought these countries under the sovereignty of the Turkish Sultan. Horuk, the elder of the two, fell in battle against an army of the King of Spain (1518). The younger was more successful. He captured Tunis and fought under Sultan Solymán II

against Charles, defeating the Imperial Admiral Doria, and ravaged the Ionian Islands. He died in 1546. Consult: Lane-Poole and Kelley, *The Story of the Barbary Corsairs* (New York, 1890); Rang and Denis, *Histoire de Barberousse* (Paris, 1837).

BARBAROUX, bār'ba'rōō', CHARLES JEAN MARIE (1767-94). A French revolutionist. He was born in Marseilles, and as a youth eagerly embraced the doctrines of the Revolution. He was elected a special delegate from Marseilles to the Legislative Assembly in Paris. There he opposed the court and took sides with the Minister, Roland. Upon his invitation the famous battalion which brought the "Marseillaise" to Paris and led in the storming of the Tuileries on Aug. 10, 1792, set out from Marseilles. After the events of the 10th of August he returned to his native town, where he was received with enthusiasm and was soon after chosen delegate to the Convention. In the Convention he adhered to the Girondists and was among those who at the trial of the King voted for the death sentence. But though Barbaroux was among those leaders who refused a respite to the unfortunate Louis, he boldly opposed the party of Marat and Robespierre and even directly accused the latter of aiming at the dictatorship. Consequently he was proscribed as a royalist and an enemy of the Republic in May, 1793. He wandered about the country, hiding himself as he best could, for 13 months, but was taken and guillotined at Bordeaux, June 25, 1794. Barbaroux was a man of striking beauty and of great force of intellect, a sound economist and financier. His *Mémoires* were published in Paris in 1822 and 1866.

BARBARY APE. A monkey, native to north Africa and introduced on the rock of Gibraltar. See APE.

BARBARY POWERS, WARS WITH THE. From the time of the Middle Ages the Mohammedan powers on the north coast of Africa lived largely by piracy and blackmail, capturing and confiscating (or holding for ransom) the shipping of such nations as did not pay a liberal tribute. In 1785 they began to molest the American shipping, which before the Revolution had been protected by British passes; and the United States government, following the example of European powers, concluded treaties with Morocco (1786-87), Algeria (1795), Tripoli (1796), and Tunis (1799), securing immunity from attack by money payments. The corsairs continued arrogant, however; and in 1801 Tripoli, after having been denied a larger tribute, declared war. American squadrons were sent to the Mediterranean under Commodores Dale (1801), Morris (1802), and Preble (1804); the Tripolitan ports were blockaded and bombarded; a number of the piratical cruisers were captured; and in June, 1805, Tripoli was forced to make peace. The chief events of the war were the grounding and capture of the *Philadelphia* in the harbor of Tripoli (Oct. 31, 1803) and her destruction by Decatur (Feb. 16, 1804), the bombardment of Tripoli, and the celebrated land expedition under William Eaton in 1805. (See BAINBRIDGE, WILLIAM; DECATUR, STEPHEN; EATON, WILLIAM.) Renewed attacks by the Barbary vessels began with the abandonment (in 1810) of the restrictive policy exemplified in the embargo of 1807. (See EMBARGO.) Algeria formally declared war in 1812 and gave considerable assistance to the British in the years 1812-15. In 1815 Decatur, proceeding with 10

vessels to the Mediterranean, speedily brought Algeria to terms and in addition forced Tunis and Tripoli to sign treaties formally renouncing future exactions of tribute. The United States was the first power thus to check the aggressions of the pirates, and her example was soon followed by various countries of Europe. These wars gave an efficient training to the American sailors and demonstrated the futility of Jefferson's famous "gunboat system." Consult: Lane-Poole and Kelley, *The Story of the Barbary Corsairs* (New York, 1890); E. S. Maclay, *History of the Navy* (3 vols., New York, 1894-1901); Allen, *Our Navy and the Barbary Corsairs* (New York, 1905). An excellent account is also given in Henry Adams's *History of the United States from 1801 to 1817* (9 vols., New York, 1889-91).

BARBARY STATES (derived from *Berbers*; see below). The countries of Morocco, Algeria, Tunis, and Libya (Tripoli and Barca or Bengazi), in north Africa, known in Roman times as Mauretania, Numidia, Africa Propria, and Cyrenaica. They lie between long. 10° W. and 25° E., and lat. 25° to 37° N. The western half of this region is traversed by the Atlas Mountains, south of which lies the desert tract of the Sahara. Most of the region, while pertaining geographically to Africa, is not specially African in its characteristics; but in geological configuration, climate, flora, and fauna, belongs to the basin of the Mediterranean. It is watered by many small streams, which flow either into the Mediterranean or into a series of salt lakes that lie on the plateaus between the mountain elevations. A large portion of the country is capable of cultivation, and many of the products of the north, fruits and vegetables, are brought to great perfection, the Algerian grape being of particularly fine quality. Millet and other grains are largely grown. Sheep raising is an extensive industry with the Arabs. During the times of the Carthaginians, Greeks, and Romans the region was exceedingly productive, owing to the elaborate systems of irrigation which were constructed. Most of the natural conditions of its ancient productiveness still remain. Among the people, besides the French and other Europeans, several distinct races may be enumerated: Berbers—the ancient autochthonous race from whom comes the name—Moors and settled Arabs, Bedouins or wandering Arabs, Jews, Turks, Kuluglis, and negroes. The Berbers inhabit the open country, while the Moors reside in the towns. Jews settled here in ancient times, but the greater number of that race immigrated at the time of their expulsion from Spain. The Turks entered the Barbary states in the sixteenth century and soon extended their sway westward as far as the borders of Morocco. The Kuluglis (the children of Turks by native mothers) are excluded from the possession of all the paternal rights and privileges. The negroes are not natives, but are brought thither principally from the Sudan and Guinea. The great majority of the population is Mohammedan. Arabic is the language of commerce and intercourse and the mother tongue of Bedouins, Moors, and even Jews. The Berbers proper, in the highlands, to which they have been driven by foreign conquerors, use a peculiar speech.

In the oldest historical times the Mauri (the ancestors of the modern Moors) dwelt in the northwest; the Numidians occupied the interior and eastern parts; and Phœnician colonies were situated on the coasts. The Phœnicians founded

cities—among them Utica, Hippo, Hadrumetum, Leptis, and afterward Carthage—from about 1050 to 850 B.C. Confining themselves to the coast between the Great Syrtis and the Straits of Gibraltar, they maintained commerce with the people of the interior and the seaports of the Mediterranean. In the seventh century B.C. the Greeks founded Cyrene (q.v.) and colonized the plateau of Barca. While the Phœnician colonies held sway on the coast, the Mauri and the Numidians were divided into several independent tribes and, like their neighbors, the Gætuli, were wholly uncivilized. After the Second Punic War the Romans extended their sway over Carthaginian Africa, which became a Roman province at the close of the Third Punic War, when the city of Carthage was sacked and destroyed (146 B.C.). Numidia was annexed after the victory over Jugurtha, and Mauretania after the defeat of Juba and the Pompeians by Cæsar. The son of Juba, bearing the same name, was allowed to reign as a nominal sovereign by Augustus, but Mauretania was in fact a Roman province. The territory thus acquired by the Romans formed some of the largest and most flourishing provinces of their vast Empire. They built large towns, whose extensive ruins are still to be seen scattered over the land, even to the verge of the desert. Everywhere they executed important works, such as the cisterns and aqueducts at Rusicada, Hippo, and Cirta, and the temples and amphitheatres of Calama, Anuna, and Tingad, which clearly show that the inhabitants enjoyed the benefits of a secure civilization. Under Constantine north Africa was divided into nine provinces. (Consult Boissier, *Roman Africa*, Eng. trans., New York, 1899; Bouchier, *Life and Letters in Roman Africa*, Oxford, 1913. For distinguished men of letters in Africa or from Africa, see APULEIUS; FRONTO; TERTULLIANUS.) At the division of the Empire all of these, except one, the Regio Syrtica, fell to the share of the Western Empire. Christianity took a strong hold in Roman Africa, and in the three Mauretanias there were more than 160 dioceses. The decline of Roman power produced a state of anarchy in the African provinces, and they easily fell a prey to the Vandals under Genseric in 429 A.D. The Vandal kingdom continued until 533, when it was overthrown by Justinian's great general, Belisarius (q.v.). The Numidians and the Mauri made themselves masters of the interior and of the coast of Mauretania Tingitana, and the Byzantine territories were restricted to the neighborhood of Carthage and some points on the coast. Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

North Africa was swept in 647 by an Arabic invasion, impelled by the first Mohammedan impulse of conquest. The first invader, Abdallah-ben-Said, carried the banner of the Crescent through Tripoli. He was followed by Akbar (665-670), who completed the conquest of Tripoli to the edge of the desert. Hassan, the general of the Caliph Abd-el-Malek, in 692 destroyed the new Carthage. In the course of less than a century the greater part of the native tribes were converted forcibly to the faith of Islam. In 711 the Saracens crossed over from Africa into Spain, which they conquered within three years. In 789 the western provinces of Mohammedan Africa separated themselves from the others, and Edris-ben-Abdallah founded there the dynasty of the Edrisites. In 800 the Gov-

ernor of the eastern provinces, Ibrahim-ben-Aglab, declared himself independent and founded the dynasty of the Aglabites. From this time down to 1269 the changes of dynasty in Barbary were frequent. Numerous independent states arose. At the close of the eleventh century the Almoravides, who had established their sway in Morocco, made themselves masters of Mohammedan Spain. In the middle of the twelfth century they succumbed to the Almohades. The conquest of the Moors in Spain by the Christians was followed by their settlement on the coast of north Africa, where they began their career of piracy, at first as a retaliation against their Christian foes, but ultimately as a barbarous profession. As early as the time of Ferdinand the Catholic the Spaniards sought to check their ravages, and invaded Africa on several occasions, capturing the ports of Ceuta, Melilla, Oran, Bugia (Bougie), the island before Algiers, and Tripoli. The Portuguese landed on the coast of Morocco, where at first they had great success; but they were ultimately compelled to leave the country. In the course of the sixteenth century Algiers, Tripoli, and Tunis were brought under the government of the Turkish Sultan. Tripoli came under the sovereignty of Italy by the Treaty of Ouchy, Oct. 18, 1912. The Dey of Algiers shook off the authority of Turkey about the beginning of the eighteenth century. The French established their sway in Algeria after a bloody war, which lasted from 1830 to 1847. In 1881 Tunis was placed under French protection. For an account of the modern states comprised within this region, see MOROCCO; TUNIS; ALGERIA; TRIPOLI; FEZZAN; BARCA.

BARBASTELLE, bär'bá-stél (Fr. from Lat. *barba*, beard). A European long-eared bat. See BAT.

BARBASTRO, bär-bä'strö. A town in the province of Huesca, Aragon, Spain, on the Vero, 30 miles southeast of Huesca (Map: Spain, F 1). It is the terminus of a branch railway line with a junction at Selgua, 12½ miles distant. The town is an episcopal see, is surrounded by walls, and has a sixteenth-century cathedral, containing paintings by Antonio Galaran. Spirits and soap are manufactured, and wine, oil, grain, fruit, and vegetables are grown. Pop., 1897, 7194; 1900, 7033; 1910, 7202.

BARBATELLI, bär'bá-tèllé. See POCETTI, BERNARDINO.

BARBAULD, ANNA LETITIA (1743-1825). An English author. She was born, June 20, 1743, at Kibworth, Leicestershire, where her father, the Rev. John Aikin, a Dissenting clergyman, kept an academy. Her private education, the religious influence of her home, and secluded life in the country were well fitted to develop early her natural taste for poetry. In 1773 she published her first volume of poems, of which four editions were called for during the year. The same year appeared *Miscellaneous Pieces in Prose*, written conjointly with her brother, John Aikin. This volume was also several times reprinted. The next year she married the Rev. Rochement Barbauld, a Dissenting minister at Palgrave, in Suffolk, where they soon opened a boarding school for boys. The literary fame and exertions of Mrs. Barbauld soon made it known. During the 10 years in which Mrs. Barbauld was engaged in giving instruction here, she published *Early Lessons for Children* and the *Hymns in Prose*—works which have been often reprinted in England and translated into

several languages. Her *Devotional Pieces* was also published during this period. In 1792 she commenced with her brother the well-known series, *Evenings at Home*, which was completed in three years. In 1804 she edited the letters of Samuel Richardson, prefixing to them the best memoir of the novelist that has yet been written; and in 1810 she published a collection of the British novelists in 50 volumes, the task of editing which she had undertaken to divert her mind from the loss she had sustained two years before in the death of her husband. In 1811 she prepared, under the title *The Female Speaker*, a selection from the best English poets and prose writers. Her last published work was an ode, entitled *Eighteen Hundred and Eleven*. All her compositions are characterized by simplicity of feeling, an easy, flowing style, and pure and elevated sentiment. Her *Ode to Life* is an admirable lyric. She lived in quiet retirement until her death, March 9, 1825. Consult: Aikin, *Works of A. L. Barbauld*, with memoir (London, 1825); Mrs. Oliver (formerly Mrs. Ellis), *Memoir of Mrs. Anna Letitia Barbauld* (Boston, 1874); Mrs. Thackeray-Ritchie, *Book of Sibyls* (London and New York, 1883).

BARBE-BLEU, bär'b'ble' (Fr. Bluebeard). 1. A light opera presented in 1866, libretto by Meilhac and Halévy, score by Offenbach. 2. Comic opera by Sedaine, with score by Grétry, performed in Paris, 1789. See BLUEBEARD.

BAR'BEQUE. A term originally applied, in the Southern States especially, to the practice of roasting a hog, ox, or other large animal entire, by splitting it to the backbone and placing it on a rude gridiron of stakes. The use of the word is now extended to mean a large public entertainment, held in the open air, where animals are roasted whole, and food and drink of all kinds are provided in liberal quantities. The word was in use in Virginia before 1700. The origin of the name "barbecue" is disputed. Some think it comes from the Indians of Guiana, who used the word *berbekot* to denote the wooden grills on which they smoked or dried their meats and fish. Others would derive it from the Haitian *barbacoda*, identical in meaning with *berbekot*, while still others have traced the term to the French *barbe-à-queue*, i.e., 'from snout to tail.'

BARBED AND CREST'ED. Heraldic terms indicating that the gills and combs of a cock are of a different tincture from the body. The common English designation is "wattled and combed," with the name of the tincture.

BARBED WIRE. See WIRE.

BAR'BEL (LL. *barbellus*, dimin. of *barbus*, same meaning, from Lat. *barba*, beard). An Old World carp-like fresh-water fish of the cyprinoid genus *Barbus*, with four fleshy appendages (barbules) hanging from the snout and upper jaw, which project beyond the inferior mouth and are of use in plowing through the mud in search of food. The common one (*Barbus vulgaris*) is abundant in the streams both of England and continental Europe and may reach a weight of 15 to 18 pounds. It affords some sport to the angler, but its coarse flesh is seldom eaten. The genus is very numerous in edible species in the waters of Asia, the East Indian Archipelago, and tropical Africa, and some reach a length of 6 feet. The best known from the angler's point of view is the mahaseer (*Barbus mosal*) of the mountain streams of the Himalayas and other parts of Asia, the scales

of which in large specimens are as large as one's hand. See Plate of CARPS AND ALLIES.

BARBE-MARBOIS, bär'ba' mār'bwä', FRANÇOIS, MARQUIS DE (1745-1837). A French statesman. From 1779 to 1785 he was connected with the French embassy in the United States. He married (1783) a daughter of William Moore, of Pennsylvania. In 1785 he was Governor of Haiti, where he introduced many reforms. In 1797 he was exiled to Guiana for political reasons, but was recalled in 1799 and made Minister of Finance in 1801. He negotiated the sale of Louisiana to the United States and obtained 30,000,000 francs more than Napoleon really asked, for which he was liberally rewarded. He was a member of the Senate in 1813 and favored the restoration of the Bourbons, for which Louis XVIII made him a Peer of France and Minister of Justice. After the Revolution of July he swore fealty to Louis Philippe. Among his works are writings on Santo Domingo and Guiana, on the treason of Arnold, and on the cession of Louisiana.

BAR'BER (ME. *barbour*, OF. *barbeor*, from Lat. *barba*, beard). One who shaves the beard and ordinarily includes hair cutting in his profession. The office is of great antiquity and is referred to by the prophet Ezekiel: "And thou, son of man, take thee a barber's razor, and cause it to pass upon thine head and upon thy beard." From ancient monuments and papyri we know that the Egyptians shaved both the beard and the head. In all Eastern countries, including China, the shaving of the whole or part of the head continues to be performed by barbers. The barber shops of Athens and Rome were great meeting places for idlers and gossips, and in provincial towns they continue to serve some such purpose up to the present day.

The most important and dignified portion of the history of barbers relates to the period when in all European countries they had the right to practice elementary medicine and surgery and were known as *barber surgeons*. Relics of this combination of functions are the brass basin, still hung out as a sign at the door of European barber shops, and the red band about the pole, which represents the bandage with which they stopped the bleeding incident to their operations. The existence of barbers as professors of the healing art can be traced in England as far back as 1461, when they were first incorporated. In 1546 they were united with the surgeons. The connection was dissolved by an Act of 1745, whose preamble asserts that the business or trade of a barber is "foreign to, and independent of, the practice of surgery"; at the same time the privileges of the barbers as a company or corporation were expressly preserved to them. In Markwell Street, Cripplegate, London, the ancient hall formerly used by the barber surgeons is still standing.

In France barber surgeons were organized in 1371 into a corporation which was under the jurisdiction of the King's barber and which existed until the Revolution. In the seventeenth century wigs (q.v.) became so elaborate that a distinct corporation was formed of *barbiers per-ruquiers*, who also shaved and cut the hair. In Germany, though the trade of the barbers was long connected with the art of surgery, they were not formed into a corporation until 1773 (in Prussia, 1779). This was dissolved in 1809, and new unions were formed in the middle of the century with strict regulations. In the

United States to-day the barbers are well organized in the International Union, which dates from 1887 and maintains an *esprit de corps* unsurpassed by any other labor organization. It not only regulates wages and the hours of labor, but fixes prices to be charged to patrons—a rare instance in which employees, rather than employers, make prices for the public. Every raise in barbers' wages must, under union rules, be followed by a corresponding increase in prices and vice versa. Consult *Annals of the Barber Surgeons of London* (London, 1890), and L'Espinasse, *Les métiers et corporations de la ville de Paris* (Paris, 1886-97). See BEARD; HAIR DRESSING.

BARBER. A widespread South African catfish (*Clarias capensis*). It reaches 50 to 60 pounds in weight, and young ones are esteemed as food; it is also one of the main resources of crocodiles. It takes the hook readily and gives some sport in overcoming its pluck and strength.

BARBER, FRANCIS (1751-83). An American soldier, born at Princeton, N. J. He graduated at the College of New Jersey (Princeton) in 1767, and in January, 1776, entered the American army as major of a New Jersey regiment. He became a lieutenant colonel in November of the same year, was adjutant-general successively under Lord Stirling and General Sullivan, and was seriously wounded at the battles of Monmouth and Newtown and the siege of Yorktown. In 1781 he was selected by Washington to break up a mutiny of the New Jersey and Pennsylvania troops—a duty he performed with singular tact and discretion. He was accidentally killed by a falling tree at Newburgh, N. Y., on Feb. 11, 1783. His order book during Sullivan's expedition against the Indians in 1779 is in the possession of the New Jersey Historical Society.

BARBER, JOHN WARNER (1798-1885). An American historian, born at Windsor, Conn. He published: *Historical Scenes in the United States* (1827); *Religious Events* (1832); *the Historical Collections of Connecticut* (1836) and of *Massachusetts* (1839); *Elements of General History* (1844); and *Our Whole Country. Historical and Descriptive* (1861). He also assisted Henry Howe in compiling the historical collections of New York, New Jersey, Virginia, and Ohio.

BARBERINI, bār'bā-rē'nē. The name of a celebrated Italian family, prominent in connection with the history of the papacy in the seventeenth century. The Barberini settled in Florence in the eleventh century and became prominent in various ways. Francesco Barberini, a contemporary of Dante, was a jurist and poet. Raffaele Barberini was an engineer and was employed by the Duke of Alva in a diplomatic capacity. The family became powerful through Maffeo Barberini, who was elected Pope in 1623 as Urban VIII. He appointed his brother Carlo commander of the papal forces; another brother, Antonio, was Cardinal and papal librarian. Francesco, a son of Carlo, was also Cardinal, and is known as the founder of the Barberini Library and the builder of the Barberini Palace at Rome. He was a man of learning and translated Marcus Aurelius. Taddeo, a brother of Francesco, became commander of the papal forces, was appointed Prefect of Rome, and received the principality of Palestrina. He attempted to wrest Castro from the Farnese family of Parma. Antonio, a brother of the two preceding, likewise a Cardinal, was invested with

the duchy of Urbino. The wealth and power of the Barberini excited the jealousy of other Italian nobles, and when Urban's successor, Innocent X, ascended the papal throne, he called the nephews of Urban to account for the mismanagement of their various offices. They were forced to flee, and took refuge in France. Later the family regained their influence in Rome. The principality of Palestrina remained in possession of the Colonna branch of the Barberini family until 1889, when the male line became extinct. The title then passed by marriage to Marquis Luigi Sachetti, who assumed the name of Barberini and the title of Prince of Palestrina. Consult Reumont, *Beitrag zur italienischen Geschichte*, vol. v (Berlin, 1867), and Thomas, *Francesco da Barberini* (Paris, 1883).

BARBERINI FAUN. A statue in Parian marble, an example of Greek sculpture, so called because once the property of the Barberini at Rome. It is now in the Glyptothek at Munich. It was found between 1627 and 1641, near the Castello di Sant' Angelo. Consult Heinrich Bulle, "Der Barberini Faun," in *Jahrbuch des kaiserlich deutschen archaologischen Instituts* (Berlin, 1901); Furtwängler, *Beschreibung der Glyptothek zu Munich*, pp. 199-206 (Munich, 1900).

BARBERINI PAL'ACE. The home of the Barberini in Rome, the erection of which was undertaken by Urban VIII, the most celebrated of the family. It was not completed, however, till 1640. Its picture gallery contains Guido Reni's "Beatrice Cenci"; Domenichino's "Adam and Eve Being Driven out of Paradise," and Albert Dürer's "Christ Disputing with the Doctors." Its library, which contains upward of 70,000 volumes and 10,000 manuscripts, now forms part of the library of the Vatican.

BARBER OF SEVILLE. See BARBIER DE SÉVILLE.

BARBER POET, THE. See JASMIN, JACQUES.

BARBER'RY (of uncertain origin). *Berberis*. A genus of plants of the family Berberidaceæ (q.v.), consisting of two subgenera that are sometimes ranked as genera. Those with simple leaves form the subgenus *Berberis*, and those with pinnate leaves, the subgenus *Mahonia*, or ash-leaved barberry. The species are low, ornamental shrubs and native to the temperate regions of both hemispheres. The flowers are yellow and have sensitive stamens. The leaves are various shades of green and are sometimes variegated. A yellow fungus, *Æcidium berberidis*, is very general upon the under side of the leaves. This is the "æcidium state" of the common grain rust (*Puccinia graminis*, q.v.), and hence in wheat-growing districts the planting of barberry is not advised. The fruit is a red, dark-blue, or black berry with two or three seeds. It is generally too acid to be eaten, but is sometimes used to make jelly and preserves—barberries cooked with molasses being an old-fashioned kind. Free malic acid is extensively prepared from the fruit in France. The fruit of the sweet barberry (*Berberis dulcis*), a native of Chile, resembles in size and color that of the black currant. *Berberis aristata* and *Berberis asiatica* also produce wholesome and pleasant fruits, which are dried like raisins. The yellow root of the barberry, especially the inner bark, is used for dyeing, as is also that of the stem and branches. The bark has also been used for tanning. *Berberis lycium*, a native of northern India, is particularly astringent, and an extract

prepared from it is used in ophthalmia. *Berberis vulgaris* is the most common species used for ornament. See Plate of BALSAM, ETC.

BARBERRY RUST. See RUST.

BARBER'S ITCH (*Tinea sycosis*; *sycosis parasitica*; ringworm of the beard). A parasitic disease of the bearded parts of the face, caused by the entrance into hair follicles of a fungus, the *trichophyton*. An eruption appears in the form of a ring, red and scaly, and increasing by the enlarging of the outer limits of the ring. Later the red area swells, and hard nodules form, which rupture and exude yellowish pus. This dries and forms crusts, covers the skin, and causes irritation and itching. The disease results in the destruction of the hair and may persist indefinitely unless treated thoroughly or may relapse repeatedly. The upper lip is very rarely attacked, the disease confining itself, as a rule, to the chin and adjacent parts of the neck and submaxillary regions. Barber's itch is contagious and is conveyed most commonly, as its name implies, by infected hands, towels, brushes, or razors.

BARBERTON. A mining town of the Vaal River Colony, South Africa, in the district of Lydenburg, about 70 miles west of Lourenço Marques, with which it is connected by rail (Map: Transvaal Colony, E 2). It lies in a mountainous region, 2800 feet above the sea, in the centre of the De Kaap gold fields. Barberton was founded in 1885 and grew rapidly. The town is a health resort. Pop., 1907, 2379. In the early part of the Boer War of 1899-1902 British prisoners were confined here until the Boers were driven out by the English troops.

BARBERTON. A city in Summit Co., Ohio, 7 miles south by west of Akron, on the Baltimore and Ohio, the Erie, the northern Ohio, and the Pennsylvania railroads and on the Ohio Canal (Map: Ohio, G 3). It manufactures matches and match machinery, boilers, chemicals, sewer pipe, valves and fittings, artificial lumber, rubber, porcelain, paint, etc. Barberton, originally known as New Portage, was settled about 1815 and was first incorporated in 1892. The government is vested in a mayor, elected biennially, and a unicameral council. The water works and light plant are owned and operated by the city. Pop., 1900, 4354; 1910, 9410.

BARBES, bär'bēs', ARMAND (1809-70). A French revolutionist. He was a leader of secret political societies, was at various times imprisoned, and in 1839 was sentenced to death as the main instigator of an attempted insurrection against Louis Philippe. While in prison he wrote *Two Days under Condemnation of Death*. He was pardoned and chosen (1848) to the Constituent Assembly, but in the same year, with Raspail and others, was sentenced to life imprisonment for inciting insurrection against the Assembly. When set free by Napoleon III in 1854, he refused to receive pardon, asking to be allowed to return to jail; but this was denied him, and he left the country. Consult La Brugère, *Le procès Armand Barbès*.

BAR/BET (Fr. from Lat. *barbatus*, bearded). Any bird of the tropical family Capitonidæ, so called in reference to the prominence of bristles about the mouth. The barbets, together with the honey guides, form the order Scansores. There are considerably over 100 forms, distributed through the tropical forests

of both the Old and New Worlds, being absent only from the West Indies and Australia. They are stockily built birds, usually less than 6 inches in length and often gorgeously colored. The juxtaposition of most vivid and extreme pigments, however, produces an inharmonious and harsh effect. Barbets haunt the tree tops or climb about the branches in search of food, which consists mainly of insects and to a less extent of fruit. They nest in holes, excavating for themselves in soft or decaying wood. Three to five oval white eggs are laid. See Plate of TROGON, HOOPOE.

BARBETTE, bär-bët' (Fr. dim. of *barbe*, Lat. *barba*, beard). In military fortification, a term applied to the platform on the inner side of a parapet or rampart on which a heavy gun is mounted. It is built at such an elevation that the gun may be fired over the crest of the parapet instead of through an embrasure. In this way the gun may be moved in different directions. In the United States and British navies the term is commonly used to designate the armored structure surrounding and protecting the bases of guns or turrets, but which is more properly called a *barbette tower*. These towers are almost invariably of circular form, the armor extending down to the protective deck, except when it is protected by the armor on the ship's side, while the supporting framework, somewhat changed in form as it goes down, extends to the inner keel. Inside the tower is the machinery for operating guns and supplying them with ammunition. See FORTIFICATION; SHIP, ARMORED.

BARBETTE GUN. A gun mounted for firing over a breastwork or parapet and not through a porthole or embrasure. On board ship guns are mounted *en barbette* in barbette towers. See COAST ARTILLERY; GUNS, NAVAL; ORDNANCE.

BARBETTE TURRET. A revolving tower or turret mounted above a fixed barbette tower. Turrets are now generally oval or ovoidal in plan, and the side in rear of the guns projects beyond the walls of the barbette tower to form the "overhang". See TURRET.

BARBEY D'AUREVILLE, bär'bä' dö're-vè'yé', JULES AMÉDÉE (1808-89). A French writer, born at Saint-Sauveur-le-Vicomte (Manche). He was one of the founders (1858) and editors of the *Réveil* and for a number of years contributed literary articles to the *Pays*. His works, in both fiction and criticism, are original, sometimes grotesque in flavor. They include: *Du dandysme et de George Brummel* (1845; 3d ed., 1880); *Les prophètes du passé* (1851); *L'ensorcelée* (1854); *Portraits critiques* (1863); *Le chevalier Des Touches* (1864); *Goethe et Diderot* (1880). Consult Eugène Gréllé, *Jules Barbey d'Aureville, sa vie et son œuvre* (1902).

BAR/BICAN (LL. *barbacana*, *barbicana*; perhaps akin to Ar. *barbakh*, aqueduct, sewer). A fortified advanced work protecting a passage, gate, or postern of a city or fortress, usually at the head of a drawbridge. The barbican was used in all well-fortified places to facilitate sallies or protect a retreat. It was built of wood or earth, or stone, provided with a ditch and often with a flying bridge. Usually it was semicircular. Even temporary camps had large barbicans to mask and protect manœuvres. The permanent examples in stone at Carcassonne (q.v.) are of unusual importance. Sometimes

they were closed across their end so as to make it difficult for the enemy to enter the city, even after it had been captured. The famous English castles of Alnwick and Warwick still retain their barbicans. In an assault the barbican was usually captured before the outer bailey. Sometimes the barbican took the form of parallel walls advancing from the outer gate and inclosing a narrow passage to hem in the attacking force; sometimes that of a double tower on each side of a gate or bridge, and it often also served as a watchtower. From the peculiar form of the long, narrow, flaring openings pierced in such works, the term "barbican" came to be applied to such shaped openings, loopholes, or embrasures, even when they were used in other structures to let in light, to ventilate, or to carry off water from foundations. See BAILEY; BASTION; CASTLE; FORTIFICATION.

BARBIÉ DU BOCAGE, bär'byä' dü bö'kázhl', JEAN DÉNIS (1760-1825). A French geographer. He was born and died in Paris. After holding several important government positions he became professor in the Collège de France in 1809 and in 1821 was one of the founders of the French Geographical Society. His best-known works are his historical and geographical atlases. He also wrote, in conjunction with Sainte-Croix, *Mémoires historiques et géographiques sur les pays situés entre la Mer Noire et la Mer Caspienne* (1796).

BARBIER, bär'byä', ANTOINE ALEXANDRE (1765-1825). A French bibliographer. He was born at Coulommiers, studied at the Normal School, and took orders, but in 1793 left his curacy and in 1794 was appointed a member of the commission for the preservation of objects of art and science. He was delegated to collect and distribute among various libraries the valuable books obtained at the time of the Revolution through the suppression of ecclesiastical establishments. He was appointed librarian to the Directory and was also private librarian to Napoleon I, in which capacity he founded the libraries of Fontainebleau, Compiègne, Saint-Cloud, and the Louvre. At the Restoration he became director of the Crown Library and continued in that post until 1822. His bibliographic works include *Catalogue des livres de la bibliothèque du Conseil d'Etat* (2 vols., 1801-03), *Dissertation sur soixante traductions françaises de l'imitation de Jésus-Christ* (1812), and, chiefly, *Dictionnaire des ouvrages anonymes et pseudonymes* (4 vols., 1806-09), a work of much value to the student of literature for the period it covers.

BARBIER, HENRI AUGUSTE (1805-82). A French poet and novelist, born in Paris. He is remembered chiefly for his satires, *Les iambes* (1831), political and social castigations of the predominant types in the bourgeois monarchy of Louis Philippe, though the morals of the aristocracy were not spared. These satires still possess a social and historical value. The most famous of them is *La curée*. Of his other works, *Il Pianto*, dealing with Italy, and *Lazare*, with Ireland, though greatly inferior, rank next in importance. Barbier was elected to the Academy in 1869 and died at Nice, Feb. 12, 1882.

BARBIER DE SÉVILLE, bär'byä' de sä'vél' (Fr. barber of Seville). 1. A work by Beaumarchais (q.v.), rejected (1772) as a comic

opera, and subsequently given its present form as a comedy. (See FIGARO.) 2. A light Italian opera (*Il barbiere di Siviglia*): (a) by Paisiello, with adaptation of Beaumarchais's comedy as the libretto (given in St. Petersburg in 1780 and in Paris in 1789); (b) by Rossini, with book again adapted from Beaumarchais (given in Rome in 1816 and in Paris in 1819). At first unpopular, it has become one of the favorite operas.

BARBIERI, bär-byä'rè, GIOVANNI FRANCESCO. See GUERCINO.

BAR/BITON, or **BAR/BITOS** (Gk. *βάβριτον*, *βάβριτος*). A special form of the lyre, derived by the Greeks from Persia and much used on Lesbos and among the Ionians. It seems to have had more than seven strings, exceptionally long, and to have yielded a deep tone. It may be the instrument, with a small sounding board and long arms, which is carried by Alcaeus and Sappho on a vase in Munich. See LYRE.

BARBIZON, bar'bè'sôn'. A village in the department of Seine-et-Marne, France, 5 miles northwest of Fontainebleau. It has given its name to a school of French landscape painters. (See BARBIZON, THE PAINTERS OF.) Its picturesque situation on the edge of the forest and association have made it a favorite resort for artists and tourists. Pop., 1906, 484; 1911, 507.

BARBIZON, THE PAINTERS OF. A group of French painters of landscape, animal, and peasant subjects, so called because they resided and practiced chiefly at Barbizon. They are often called the Barbizon school, but, properly speaking, they do not form a school, but were a group of men with similar aims and principles. Situated on the edge of the forest of Fontainebleau, Barbizon offered countless varieties of scenery, both wild and cultivated. The cardinal principles of these painters were twofold. 1. Each painting must be studied directly from nature. This gave them the firm grasp upon truth and life that has made their art permanent. 2. Every painting should express a mood or sentiment of the artist. The result was the poetic character which lends to their work its principal charm, each picture rising to the dignity of a hymn to nature. They belonged to the Romantic school of painting (see PAINTING, History), and their work represents the romantic principle applied to the landscape. They were not really revolutionaries, as has been represented, but took up the development of the landscape where the Dutch and English had left off. (See LANDSCAPE PAINTING.) The English influence, however, has been greatly exaggerated. It is maintained that the school owed its origin to the exhibition of Constable's (q.v.) works at Paris in 1822; but at that time Rousseau and Dupré were lads of 12, while Corot was still in Italy. They learned far more from the fine collection of Dutch paintings, especially those of Ruysdael, in the Louvre. Dupré alone visited England, where he was influenced by Constable. The pioneer and broadest genius of them all was Théodore Rousseau, who first went to Barbizon. Besides his the greatest names are those of Jules Dupré, their most pronounced Romanticist, Corot, the poet painter of morning and evening; Diaz de la Peña, painter of the sunny woodland, Daubigny, the painter of orchards, gardens, and river scenery, Troyon, the cattle painter, and Jean François Millet, greatest of

all peasant painters. See articles on these artists.

The painters of Barbizon are probably the most important group of landscape painters in the history of art; they depicted varied phases of nature, made great progress, and had a wide influence upon the general development. For their art not only affected landscape painting of northern Europe, but profoundly influenced that of the United States, which is for the most part essentially mood painting and unintelligible without Barbizon. They are better represented in American galleries, such as the Metropolitan Museum of Art and the Vanderbilt collection, New York, and the Quincy Shaw collection of Boston, than in any others in the world, except only the Louvre.

Consult the spirited narrative of Muther, *History of Modern Painting*, vol. ii (London, 1907), Van Dyke, *Modern French Masters* (New York, 1906), and the special works on the *Painters of Barbizon* by Mollet (London, 1895), D. C. Thompson (ib., 1902), Arthur Tomson (ib., 1908); La Farge, *The Higher Life in Art* (New York, 1908), an able and intimate account of the Barbizon men.

BARBON. See BAREBONES.

BARBOSA DU BOCAGE, bär-bō'sà dū bō'-kizh'. See BOCCAGE, MANOEL MARIA BARBOSA DU.

BARBOSA-MACHADO, bär-bō'zà-mä-shā'dū, DIEGO (1682-1770). A Portuguese bibliographer. He was born in Lisbon, took holy orders in 1724, and received the appointment of abbot of the convent of Lamo-Adrião de Sever. Here he remained until his death, engaged in the preparation of a monumental work which contains biographical notices of all the Portuguese and Brazilian authors. It is called *Bibliotheca lusitana antiqua e nova, historica, critica e chronologica, na qual se comprehende a noticia dos autores portuguezes, e das obras que compuzão desde o tempo da promulgação da ley de graça, até o tempo presente* (4 vols., Lisbon, 1741-52). A summary of this was arranged by Bento José Farinha, *Sumario da Bibliotheca lusitana* (4 vols., Coimbra, 1820).

BARBOU, bär'bōō', JOSEPH GÉRARD (1715-1813). The most important representative of the firm of French printers of that name. Of his publications the best known are to be found in his continuation, in duodecimo, of the series of Latin classics begun by Antoine Coustelier, at the instance of the Abbé Lenglet Dufresnoy. These volumes of his are still justly noted for their careful text and excellent typography.

BARBOUR, bär'bēr, ERWIN HINCKLY. An American geologist. He was born near Oxford, Ohio, and was educated at Miami University and at Yale, where he graduated in 1882. He was assistant paleontologist to the United States Geological Survey from 1882 to 1888, and Stone professor of natural history and geology at Iowa College from 1889 to 1891. He became professor of geology in the University of Nebraska, acting State Geologist, curator of the State Museum, geologist of the State Board of Agriculture, and director of the annual Morrill geologic expeditions. Following his work in Nebraska he was engaged in United States geologic and hydrographic surveys.

BARBOUR, JAMES (1775-1842). An American politician. He was a member of the Virginia Legislature from 1796 to 1812; was Governor of the State for two terms, and was a member of the United States Senate from 1815

to 1825, when he became Secretary of War in the cabinet of President J. Q. Adams. He was appointed Minister to England in 1828, but was recalled by Jackson in the following year. He presented a bill to establish a United States Bank, was author of the anti-dueling act of Virginia, and presided over the national convention that nominated Harrison and Tyler.

BARBOUR, JOHN (c.1316-c.1395). The first of the early Scottish poets, regarding whom history has not much to record beyond the production of the national epic, entitled *The Brus*, the subject of which is Robert Bruce. The ascertained facts of Barbour's life may thus be summarized: Born about 1316, he was Archdeacon of Aberdeen in 1357 and held that office till his death; in 1357 he traveled into England, accompanied by three scholars, on a visit to Oxford; in 1365 he obtained a passport "to travel through England with six companions on horseback toward Saint Denis and other sacred places"; in 1368 he again received permission to travel through England with two servants and two horses, on his way for scholarly purposes to France; in 1373 he was clerk of audit of the household of King Robert II and one of the auditors of exchequer; in 1375 his great poem was more than half finished; in 1377 he had a gratuity of £10 from King Robert II; in 1378 he received from the same prince a perpetual annuity of 20s., which in 1380 he bequeathed to the dean and chapter of Aberdeen, under the condition that they should sing a yearly mass for the repose of his soul; in 1381 he had a gift from the crown of the wardship of a minor whose estate lay within the parish of which he was rector; in 1383, and again in 1385, he was one of the auditors of exchequer; in 1388 King Robert II granted him a pension of £10 a year; and he died probably on March 13, 1395. Besides *The Brus*, two other poems have, with reasonable certainty, been assigned to Barbour: *The Legends of the Saints*, and a poem on the Trojan War, of which only fragments remain. *The Brus* is distinguished by great purity and clearness of style, the language and versification contrasting advantageously with those of any contemporary English poet except Chaucer. Barbour's imagery is not rich, but he is seldom other than lively, simple, and energetic. He has depicted, in rough but faithful outline, the life, manners, and deeds of a truly heroic time and given to his country the first poem in her literature and the earliest history of her best and greatest king. Consult: *The Brus*, ed. by Skeat for Early English Text Society (London, 1870-89) and for the Scottish Text Society (Edinburgh, 1894); *Legends of the Saints*, ed. by Metcalfe for Scottish Text Society (Edinburgh, 1896); and Horstmann, *Barbour's Legendensammlung, nebst den Fragmenten seines Trojanenkrieges* (Heilbronn, 1881-82). Consult also Andrew Lang's *History of Scotland* (1900). See ENGLISH LITERATURE; SCOTTISH-GAELIC LITERATURE.

BARBOUR, OLIVER LORENZO (1811-89). An American lawyer and legal writer. He was born at Cambridge, N. Y., studied law, was in 1832 admitted to the bar, and was reporter of the New York Court of Chancery in 1847-49. From 1848 to 1876 he was reporter of the State Supreme Court. He published *Equity Digests* (1836-41), *Treatise on the Practice of the Court of Chancery* (1843), and many other works.

BARBOUR, PHILIP PENDLETON (1783-1841).

An American jurist. He was born in Virginia and studied law at William and Mary College. From 1812 to 1814 he was a member of the State Legislature, from 1814 to 1821 was in Congress, being Speaker of the House in 1821, and later was a judge of the Virginia General Court. Again, from 1827 to 1830, he was in Congress, and from 1836 until his death was an associate justice of the United States Supreme Court. He was a strong Southern partisan on the Missouri Question.

BARBOUR, RALPH HENRY (1870–). An American author, born at Cambridge, Mass. He contributed verse and short stories to magazines under the pen name of "Richard Stillman Powell," but became best known under his own name for entertaining boys' stories. His writings include: *The Halfback* (1899); *Captain of the Crew* (1901); *On your Mark* (1904); *Four in Camp* (1905); *Four Afoot* (1906); *Holly* (1907); *Four Afloat* (1907); *Forward Pass* (1908); *Double Play* (1909); *Winning his "Y"* (1910); *Team Mates* (1911); *Cupid en Route* (1912); *The Junior Trophy* (1913); *Peggy-in-the-Rain* (1913).

BARBOURSVILLE. A town in Cabell Co., W. Va., 9 miles by rail east of Huntington, the county-seat; on the Guyandotte River and on the Chesapeake and Ohio, and the Guyandotte Valley railroads (Map: West Virginia, B 3). It is the seat of Morris Harvey College (Methodist Episcopal, South), opened in 1888, and the Kuhn Memorial Hospital, and is of historic interest as the scene of a conflict in the Civil War, July, 1861, which terminated in a Federal victory. Barboursville became a town by an Act of the Virginia Legislature in 1813, was incorporated in 1867, and formerly was the county-seat. The town has manufactories of lumber and brick and owns its water works and electric light plant. There are deposits of coal, oil, and gas in the vicinity. Pop., 1900, 429; 1910, 907.

BARBOURVILLE. A town and the county-seat of Knox Co., Ky., 188 miles by rail southeast of Louisville; on the Cumberland River, and on the Louisville and Nashville Railroad (Map: Kentucky, G 6). The principal industries are agriculture, coal mining, and lumbering; there are several saw and grist mills. Oil wells of considerable promise have been drilled, and the country is developing rapidly. Pop., 1890, 1162; 1900, 1010; 1910, 1633.

BARBOX BROTHERS. A short story by Charles Dickens in *All the Year Round* (1866). There is a second part entitled *Barbox Brothers & Co.*

BARBOZA. See CALDAS-BARBOSA.

BARBUDA, bār-bōō'dā (Portug. island of bearded men). One of the Leeward Islands in the British West Indies, situated 20 miles north of Antigua (q.v.), of which it is a dependency (Map: West Indies, G 3). The island, of coral formation, has an area of 73 square miles, with a generally level surface, which is to some extent covered with forests. The main occupation of the inhabitants is cattle raising. In 1911 Barbuda had a population of 775, mostly colored.

BARBUDO, bār-bōō'dō, or **BARBU,** bār-bōō'. Names given to the thread fins of the genus *Polydactylus*, within the family Polynemidae and the suborder Rhegnopteri, small fishes of the warmer American seas allied to the sand lance. The commonest species (*Polydactylus virginicus*) is a food fish of some importance in the West Indies and Florida, found in abundance off sandy shores. It is illustrated on the Plate of MULLET and ALLIES.

BARBY. A town in the province of Saxony, Prussia, on the left bank of the Elbe, near the mouth of the Saale, 16 miles southeast of Magdeburg (Map: German Empire, D 3). It has a normal school and a home for the blind and is the seat of a district court. The manufactures include bricks, beer, and confections. The town is well built, has a mediæval castle, and was the seat of a countship. Pop., 1900, 5137; 1905, 5301; 1910, 5292.

BARCA, or BARCE, bār'sā (Gk. Βάρκη, *Barkē*). An ancient city in Cyrenaica, in the district of Barca, Africa. The ruins are now known as Medinet-el-Merj. It was founded by a Cyrenæan colony about 554 B.C. The Persians captured and pillaged the city about 510 B.C., and many of its people were led off as captives into Bactria. Under the Ptolemies it assumed considerable importance as a seaport.

BARCA, or BENGAZI. Since Oct. 18, 1912, an Italian possession, part of Libia Italiana (formerly a Turkish mutessarifat) in north Africa, situated in long. 20° to 25° E., and lat. 29° to 33° N., between Tripoli, Egypt, and the Libyan Desert, and bounded on the north by the Mediterranean Sea (Map: Africa, G 1). It has an estimated area of 20,000 square miles and a population of about 300,000, consisting mainly of Berbers, Arabs, Turks, and Greeks. It is an arid, elevated plateau, for the most part covered with sand. A range of mountains reaching in Jebel Akhdar an elevation of 3300 feet traverses the northern part from east to west. A fringe of fertile plains of red alluvium on the borders affords good arable and pasture land and contributes to the principal industries—agriculture and cattle raising. Considerable quantities of grain and cattle are exported. The sponge fisheries are also important. The chief imports are textiles and drugs. In the time of Cyrus Barca became a state which proved dangerous to the neighboring state of Cyrene, but within a century it became subject to Egypt. In the Roman period its inhabitants were noted for their predatory incursions. It was afterward a province of the Byzantine Empire and had declared itself independent when the Arabs invaded and conquered it in 641. It became part of Tripoli, later a separate province under Turkish dominion. By the Treaty of Ouchy, signed by the Turkish and Italian delegates Oct. 18, 1912, it was formally recognized as a dependency of Italy; it forms with Tripoli the new Italian colony Libya (q.v.).

BARCA (Sp., It. bark). A small two-masted vessel. A *barca-longa* is a large Spanish coasting vessel having pole masts and lugsails; the name is also applied to a gunboat. Both terms are used in the Philippine Islands in the senses given.

BARCA, or BARCAS (Gk. Βάρκας, *Barkas*; Punic, lightning, gleaming; cf. Heb. *barak*, a gleaming, or gleaming sword). A surname which was applied to Hamilcar and other Carthaginian commanders.

BARCAROLLE, bār'kā-rōl (It. *barcarolo*, boatman, from *barca*, boat). A species of song peculiar to the gondoliers of Venice. Hence the name is applied to musical compositions of a similar character; usually for voice, more rarely for instruments.

BARCELONA, bär'chël-lō'nā. A city in Sicily, on the Longano, 27 miles west of Messina (Map: Italy, K 9). It is famous for sulphur baths that are frequented from May to September. The suburb of Pozzo di Gotto is separated from the main town by a small stream, the Fiume di Castro Reale, supposed to be the Longanus of antiquity. Oil, manna, wine, and fruit are the most important products. There are fine forests on the near-by mountains. The chief commerce is in oil and fish. Pop., 1881, 15,000; 1901 (commune), 23,493; 1911, 26,172.

BARCELO'NA, *Sp. pron.* bār'thā-lō'nā (anciently, *Colonia Paenonia Julia Augusta Pia Barcino*). The capital of the province of Barcelona (formerly capital of Catalonia); after Madrid the largest city in Spain and the most important maritime, commercial, and industrial centre (Map: Spain, G 2). It is situated in lat. 41° 21' 44" N., long. 2° 30' 32" E., on the Mediterranean coast, between the mouths of the Llobregat and the Besòs, in a fertile and well-populated valley surrounded by hills, 440 miles northeast of Madrid by rail, 310 miles in a direct line. It has a pleasant and equable climate (mean temperature, 61° F.) and a good municipal water supply. Barcelona consists of the old city, formerly surrounded by walls, which have been converted into promenades, and numerous suburbs of modern architecture containing the various manufacturing establishments to which the city owes a great deal of its importance. The only fortification of Barcelona is the Castillo de Monjuich, situated on an isolated mountain near the city and provided with large magazines and extensive barracks. In the older portion of the city, bounded by the *Dondas* and the *Salons*, which mark the site of the old walls, the streets, with the exception of the wide *Rambla*, the *Culle de Fernando VII* and the *Calle de la Princesa*, are narrow and crooked. They are lined with houses most beautiful in design, although of somewhat gloomy coloring. The *Rambla*, which begins at the Columbus Monument, near the harbor, and ends at the *Plaza de Cataluña*, is the favorite city promenade and contains most of the theatres, hotels, and shops. On the north side of the city is situated the magnificent public park, with its fine avenues, flower beds, lakes, and several museums, including the Museo de Reproducciones, containing a fine collection of plaster casts. The cathedral of Barcelona occupies the highest point in the centre of the old city, the site formerly of a Roman temple and a Moorish mosque. It is a magnificent building of Spanish Gothic, founded in the thirteenth century, with a spacious nave, ornamented with fine reliefs. Its 26 chapels date chiefly from the sixteenth and seventeenth centuries. The church of Santa María del Mar, in late Gothic, has a fine façade decorated with bronze statues and two towers. Among other churches may be mentioned that of San Pedro de las Puellas, dating from the tenth century, and the Gothic church of Santa María del Pino.

The secular buildings of Barcelona include the old palace of the counts of Barcelona, containing the archives; the Casa de la Diputación, erected in the fifteenth century and used by the chamber of deputies for the province; and the Casa Consistorial, containing the municipal archives. Among the more modern buildings are the exchange, the custom house, and the palace of justice. Barcelona is the seat of a supreme

court, a bishop, and the captain-general of Catalonia. It has a large number of nunneries and monasteries, to which are attached numerous educational and benevolent institutions. The University of Barcelona was founded in 1430 and confirmed in its establishment by Nicolas V in 1450, partly removed in 1714 to Cervera, and again established at Barcelona in 1837. It has faculties of philosophy, law, natural sciences, mathematics, medicine, and pharmacy, with a total attendance of about 1900 students. Other educational institutions of Barcelona include schools of architecture, engineering, commerce, agriculture, war, theology, pedagogy, etc. Elementary education is under the control of the municipality and is compulsory, but only in theory. The provincial and the university libraries have together over 154,000 volumes, and the general archives of the kings of Aragon number nearly 4,000,000 documents. The Palacio de Bellas Artes, situated in the park, is used for exhibitions of paintings and sculptures. Barcelona has a considerable number of theatres, among which the Gran Teatro de Liceo is the largest, with a seating capacity of 4000. There is also a bull ring, with a seating capacity of 14,500.

Barcelona is one of the largest cotton-manufacturing centres of Spain. Its other important manufactures are woolen and silk fabrics, metal articles, paper, glass, leather, and chemicals. Barcelona's commercial importance dates from the Middle Ages. The shipping, including the coast traffic, exceeds 3,000,000 tons per annum. The total commerce of the port amounts to over 750,000,000 pesetas (about \$150,000,000), of which about 300,000,000 pesetas (\$60,000,000) represent imports from foreign countries.

The exports consist chiefly of wine, southern fruits, and manufactures. The imports are mostly grain from Russia and the United States, cotton from the United States, hemp, metal products, and foodstuffs. Barcelona has direct communication with Germany, Morocco, Great Britain, and the West Indies. It is the seat of a United States consulate and has consular representatives from every country of importance. Municipal enterprise has improved the harbor considerably since 1880 by means of extensive moles and lighthouses.

In its administration Barcelona is the most autonomous municipality in Spain. It is governed by a council, elected by all citizens above the age of 25, who have resided not less than two years in the commune. The term of office is four years, and the council is presided over by an *alcalde*, chosen by the members from their midst. The council has charge of all the departments of municipal administration and even exercises supervision over private charitable institutions. The death rate of Barcelona is below the average for the entire country, and its sanitary conditions are improving rapidly. The city is lighted by gas and electricity, supplied by private companies. The general progress of Barcelona was accompanied by a corresponding increase of population during the last quarter of the nineteenth century. Pop., in 1887, 272,481; in 1900 (after large annexation of suburbs and manufacturing quarters), 533,000; communal *de facto* population, Dec. 31, 1910, 587,411; *de jure* population, 581,823. Consult Montpalais, *Memorias Históricas de Barcelona* (Madrid, 1779-92).

Barcelona was founded by the Phœnicians

and is said to have derived its early name of *Barcino* from Hamilcar Barca, who made it one of the centres of Carthaginian power in the peninsula. An important city under the Romans, Goths, and Saracens, Barcelona in the latter half of the ninth century became an independent sovereignty, under a Christian chief of its own, whose descendants continued to govern it (being known as the counts of Barcelona) until 1137, when Catalonia, by the marriage of its prince, Raymond Berengar, with the heiress to the crown of Aragon, became a part of that kingdom. During the Middle Ages Barcelona became a flourishing seaport, rivaled in the Mediterranean by Genoa only. To its commercial code, framed in the thirteenth century, much deference was paid by the whole of Europe. In 1640 Barcelona revolted from Philip IV, but in spite of the support of the French arms it was forced to resume its allegiance in 1652. In 1705 the fortress of Monjuich was surprised and captured by Lord Peterborough, and the city surrendered shortly afterward. In 1714, after a most heroic defense, it was stormed by the Duke of Berwick and given over to fire and sword. The French held it from 1808 to 1814. During the nineteenth century Barcelona took an active share in the political dissensions of the Spanish nation. It was the centre both of reactionary and radical agitations, and the scene of socialist and Carlist uprisings. It is here that modern Spanish anarchism has its nursery; strikes and riots are frequent within the town, and in Barcelona there is to be found much republican sentiment.

BARCELONA. The capital of the state of Barcelona, Venezuela, on the Neveri River, 3 miles from the Atlantic coast and 150 miles east of Carácas (Map: Venezuela, E 1). It is connected with the port of Guanta by a railroad. The city is at the northern limits of the fertile llanos and is regularly laid out, but is rather poorly built and unhealthful. Among prominent buildings are the government house, the Masonic Temple, a theatre, a market, hospitals, churches, and educational institutions. The city has coal and salt mines in the vicinity and is the seat of an extensive commerce in cotton, rope, and rum. Barcelona was settled in 1638 at the foot of the Cerro Santo, but in 1671 the settlement was removed to the present site of the city. It was the capital of the former state of Barcelona until 1881, when it became the capital of the state of Bermúdez, which was subsequently divided into the states of Barcelona and Sucre. The city formerly had a much larger population, which decreased considerably because its industry and trade suffered severely in the War of Independence. There is still considerable export of sugar, coffee, and tropical products. Pop., 1891, 12,785; 1899, about 9000; 1905 (est.), 13,000.

BARCLAY, ALEXANDER (c.1475–1552). A poet and satirist. He was born about 1475, but whether in England or Scotland is not certain. He studied at one or both of the English universities and then obtained, through his patron, Bishop Cornish, an appointment as priest in the college of St. Mary Ottery in Devonshire. He afterward became a monk of the Benedictine Monastery of Ely, where he remained until its suppression in 1539. He died in June, 1552, six weeks after he had been presented to the rectory of All-Hallows, London. His claim to notice rests chiefly upon his famous poem, *The*

Shyp of Polys of the Worlde—partly a translation, and partly an imitation, of the German *Narrenschiff*, originally by Sebastian Brandt—printed by Pynson in 1509 and since often reprinted. Barclay, however, knew nothing of the original, but founded his translation on a Latin version by Jacob Locher, entitled *Stultifera Navis*. The poem is interesting as showing the manners and customs of the times satirized. He published several works besides; among others, *The Myrrour of Good Maners*, *The Castell of Laboure*, *The Egloges*, the first eclogues that appeared in the English language; and also made a translation of Sallust's *History of the Jugurthine War*. In his lifetime he was admired for his wit and eloquence, and his writings exhibit a refinement not common in that age. Consult Barclay, ed. Jamieson, *The Shyp of Polys* (Edinburgh, 1874), and Hannay, *Satire and Satirists* (1854). See ENGLISH LITERATURE; SATIRE.

BARCLAY, JOHN (1582–1621). A Scottish poet and satirist. He was born Jan. 28, 1582, at Pont-à-Mousson, in Lorraine, where his father, William Barclay, a Scotchman, was professor of civil law. His mother was a Frenchwoman, but Barclay always considered himself a Scotchman. It has been said that he was educated by the Jesuits, who tried to induce him to enter their order. Whether this is so or not, he had great antipathy to them. On the accession of James to the English throne (1603), Barclay came to London, where he published the first part of the *Satyricon*, a politico-satirical romance chiefly directed against the Jesuits and the Duke of Lorraine. In 1607 a second part appeared in Paris. This was followed by the *Apologia* (1611) and *Icon Animorum* (1614), which may be regarded as further continuations of the *Satyricon*. In the meantime Barclay had published a collection of graceful Latin poems bearing the title *Sylva* (1606). In 1615 he left England and went to Rome, where he died Aug. 15, 1621. In the same year his best-known work, the *Argenis*, appeared posthumously in Paris. It was written in Latin and has been translated into several languages. There are no fewer than three translations into English; the last appeared in 1772. It is a political allegory, containing clever allusions to the state of Europe, more particularly of France, during the time of the League. *Argenis* was admired by Cowper and Coleridge. Consult Dukas, *Etude bibliographique et littéraire sur le Satyrikon* (Paris, 1880). See ENGLISH LITERATURE; SATIRE.

BARCLAY, JOHN (1734–98). A Scottish divine, the founder of a sect in the Scottish church called Barclayites, or Bereans—a name derived from the Acts of the Apostles, xvii. 2. He was assistant minister at Fettercairn, where he attracted crowds by his novel doctrines, but the Presbytery dismissed him from his position. The General Assembly sustained the Presbytery, whereupon Barclay left the church, but continued to preach in Edinburgh, London, and other cities. (See BEREANS.) He published many tracts and pamphlets. One of the more important of his longer treatises is *Without Faith, Without God; or an Appeal to God Concerning His Own Existence* (1769). His *Works* were published with a memoir (1852).

BARCLAY, JOHN (1758–1826). A Scottish anatomist. He prepared for the ministry, but became interested in natural science and devoted his life to the study of anatomy. He published, in 1803, *A New Anatomical Nomenclature*, and

in 1808 a treatise on the muscular motions of the human body. In 1812 appeared his *description of the Arteries of the Human Body*, a work of vast labor and accurate observation. In 1822 he published *An Inquiry into the Opinions, Ancient and Modern, Concerning Life and Organization*. He left to the Royal College of Surgeons in Edinburgh his admirable anatomical collection, for which a suitable hall was erected and named the "Barclayan Museum." Consult Waterhouse's "Memoir" in *Jardine's Naturalist's Library*, vol. viii (Edinburgh, 1843).

BARCLAY, ROBERT (1648-90). The celebrated apologist of the Quakers. He was born on Dec. 23, 1648, at Gordonstown, in Morayshire, Scotland. His father was the son of David Barclay, of Mathers, the representative of an old Scots-Norman family; his mother was the daughter of Sir Robert Gordon, the premier baronet of Nova Scotia and historian of the house of Sutherland. Young Barclay received the rudiments of learning in his native country and was afterward sent to the Scotch College at Paris, of which his uncle was rector. Here he made rapid progress in his studies and excited the admiration of his preceptors as well as of his relative, who offered to make him his heir if he would remain in France and formally adopt the Roman Catholic religion, to the ceremonies of which he had been habituated during his residence there. This, however, Barclay refused to do and returned home in 1664. Though only 16, Barclay was an excellent scholar and could speak Latin with wonderful fluency and correctness. In 1666 his father became a Friend, and the next year Barclay followed him. He states in his *Treatise on Universal Love*, that his "first education fell among the strictest sort of Calvinists," those of his country "surpassing in the heat of zeal not only Geneva, from whence they derive their pedigree, but all the other so-called Reformed Churches"; that shortly afterward his transition to France had thrown him among the opposite "sect of Papists," whom after a time he found to be no less deficient in charity than the other; and that consequently he had refrained from joining any, though he had listened to several. The ultimate effect of this was to liberalize his mind by convincing him of the folly and wickedness of religious strife. In both Calvinists and Catholics he found an absence of "the principles of love," "a straitness of doctrine," and a "practice of persecution" which offended his idea of Christianity as well as his gentle and generous nature. He therefore allied himself gladly to the Friends, whose distinguishing feature was their charity and pure simplicity of Christian life, and soon became one of their most devoted adherents and their ablest advocate. In the course of his life he made several excursions into England, Holland, and Germany, earnestly propagating his peaceful views wherever he went and occasionally enjoying the companionship of William Penn.

His first publication was *Truth Cleared of Calumnies*. It appeared in 1670 and was intended as a refutation of the charges—many of them notoriously false—made against the new sect. In 1673 appeared *A Catechism and Confession of Faith*, the answers to the questions being, to avoid theological dogmatism, in the words of Scripture. This was followed by *The Anarchy of the Ranters* in 1676, and the same year he published in Latin his greatest work. In 1678 he published it in English, under the

title *An Apology for the True Christian Divinity, as the same is Held forth and Preached by the People called in Scorn Quakers*. It contains a statement and defense of 15 religious propositions peculiar to the Friends. The leading doctrine which runs through the whole book is, that divine truth is made known to us not by logical investigation, but by intuition or immediate revelation; and that the faculty, if it can be technically defined, by which such intuition is rendered possible, is the "internal light," the source of which is God, or, more properly, Christ, "who is the light that lighteth every man that cometh into the world." In 1677 appeared his *Treatise on Universal Love*. It was the first of that long series of noble and gentle remonstrances against the criminality of war that has so honorably distinguished the Society of Friends. It was addressed to the ambassadors of the several princes of Europe, met at Nimeguen, and was composed in prison at Ury, near the city of Aberdeen, where he, his father, and many other Friends were confined for their faith's sake. He was released after five months and during the latter part of his life enjoyed court favor unmolested. In 1683 the Duke of York gave the Friends the patent of the province of East Jersey, and Barclay was made nominal Governor. He never came to America, however. In 1686 he published his last work, which was a defense of the doctrine of "immediate revelation." He died at Ury, Oct. 3, 1690. His estate remained in the possession of his descendants till the death, in 1854, of Robert Barclay Allardice. "The Apologist's Study," which remained much as he left it, was long an object of pilgrimage with members of the Society of Friends; but it was destroyed a few years ago, when the old house of Ury was pulled down. Barclay's works were published in a collected edition entitled *Truth Triumphant* (London, 1692; later ed., 1717-18, 3 vols.). For his biography, consult Wilson Armistead (Manchester, 1850). His *Apology and Catechism* and *Treatise on Church Government* (formerly called, as above, *The Anarchy of the Ranters*) have been reprinted by the Friends' Book Store (Philadelphia).

BARCLAY, ROBERT II. (?-1837). A Scottish naval officer. He served at Trafalgar and in 1813 fitted out the English fleet on Lake Erie. In command of this fleet he was defeated in the battle of Lake Erie, September 10, by Commodore O. H. Perry (q.v.). During the battle he was seriously wounded. Subsequently he was tried by court-martial for the surrender of his fleet, but was acquitted.

BARCLAY, SIR THOMAS (1853-). A British barrister, born at Dunfermline, Scotland. He was educated at University College, London, and at the universities of London, Paris, Bonn, and Jena. Having been sent to Paris in 1876 as correspondent of the *London Times*, he turned his attention (1882) to the study of French law practice. In 1900 he began agitation for a better understanding between England and France, in 1903 and 1904 visited the United States in the interest of an Anglo-American arbitration treaty, and in 1905 made addresses in Berlin in favor of improving British and German relations. The International Brotherhood Alliance (*Fraternitas inter gentes*) was founded by him in 1905. He was knighted in 1904, and in 1910 he became a member of Parliament. His publications include: *Companies in France* (2d ed., 1899); *The Hague Court and Vital Inter-*

ests (1905); *Problems of International Practice and Diplomacy* (1907); *The Turco-Italian War and its Problems* (1912).

BARCLAY DE TOLLY, bär-klä de tö-lä', MICHAEL, PRINCE (1761-1818). A Russian general. He was descended from an old Scottish family settled in Livonia, and entered a Russian regiment of cuirassiers with the rank of sergeant. He fought with great bravery in the Turkish War of 1788-89, in the campaign against Sweden in 1790, and in those against Poland in 1792 and 1794. In the year 1806, at Pultusk, as major general, he commanded Bennigsen's advance guard. In 1808 he distinguished himself in Finland, and in 1809 he led a force across the frozen Gulf of Bothnia to Sweden. Although hated by the Russian national party as a foreigner, he was appointed Minister of War by the Emperor Alexander in 1810, an office which he held till 1813. In 1812 he was made commander in chief of the Army of the West. His retreat to Smolensk, and the loss of the battle fought there on the 17th of August, raised the hatred of the Russian national party to a greater height than ever, and he was obliged to yield the chief command to Kutusoff. Barclay's Fabian tactics, although extremely unpopular with the mass of Russians, in the end brought about the destruction of Napoleon. At the battle of the Moskva or Borodino he commanded the right wing. After the death of Kutusoff he again rose to prominence, did brilliant service in the battle of Bautzen (1813), and was once more placed in command of the army. He afterward took part in the battles of Dresden, Culm, and Leipzig. He was made prince and field marshal. He died at Insterburg, in East Prussia.

BARCLAY SOUND. An inlet on the west coast of Vancouver Island, British Columbia, Canada (Map: British Columbia, D 5). It extends eastward for about 35 miles and is continued inland three-fourths of the way across the island by the narrow fiord, Alberni Canal, which drains the Great Central, Sproats, and Nahmint lakes. The northern and southern extremities of the sound are called, respectively, Cape Beale, marked by a lighthouse, and Amphitrite Point. Broken Group and several other islands are in its waters. Deposits of iron-bearing ores exist on its shores.

BARD (Irish *bard*, Welsh *bardd*, Cornish *bardh*, Breton *barz*). A name commonly given to poets and singers among the Celtic peoples, and mentioned by classical historians as early as the second century B.C. But they disappeared early among the Gauls of the Continent, being replaced in ancient Ireland by the satirical or panegyric poets called *filid*. Among the insular Celts they formed an important social class throughout the Middle Ages, and under modified conditions, the order exists to this day.

According to Strabo (*Geography*, vol. iv, pp. 4, 5), there were among the primitive Celts three classes of men who were the objects of extraordinary honors: the bards, the ovates, and the druids. The meagre information that we possess concerning the primitive bards permits us to believe that they were national poets or minstrels, and that they used the *chrotta*, a kind of harp.

In the old Welsh laws bards were recognized as important members of the community, with special rights and duties. They were organized in some fashion into a separate order, and it is traditionally believed that Gruffydd ap Kynan,

King of Gwynedd, made rules for their government. But on this last point there is no satisfactory proof. It should be also said that there is no evidence at all for the claim that the bardic organization of the twelfth century was a survival of the ancient Druidic hierarchy. Mr. Stephens, in his *Literature of the Kymry*, has made it clear that the Druidism of the Middle Ages was confined to the bards and was of very recent origin; and the Druidism of the modern *Gorsedd* appears to be a later development still. The writings of the Welsh bards, which dealt with a large variety of subjects, both secular and religious, are treated elsewhere in the article on **WELSH LANGUAGE AND LITERATURE**. The order of bards is still regularly maintained in Wales in connection with the Druids and ovates. From year to year, reunions (called *Eisteddfodau*, from *eisted*, 'to sit') are held, in which those who win certain prizes are granted a bardic name. Many of these are known by their fellow countrymen by no other title.

In Ireland the rank and privileges of poets were not dissimilar to those established in Wales. But the name *bard* was at first applied in Irish only to the lower order of popular rhymesters, while the poets of the schools were known as *filid* (singular, *filí*). This distinction disappeared, however, in the course of time, and the name *bard* came to be applied to all poets in Ireland as it was in Wales. Professional bardic schools were maintained down through the seventeenth century, and the old classical metres were taught in them to the end. (See **IRISH LITERATURE**.) But English rule was always unfavorable to the bards, and they practically disappeared in the course of the eighteenth century.

In Scotland, the name *bard* has been applied freely to poets down to the present time, but there does not appear to have been any regular bardic organization in the modern period.

Bibliography. Classical citations are brought together in Holder's *Altceltischer Sprachschatz* (Leipzig, 1896). Consult also for the bards of the Gauls: Dottin, *Manuel de l'antiquité celtique* (Paris, 1906); D'Arbois de Jubainville, *Cours de littérature celtique*, vol. i (Paris, 1883); *Les Druides et les dieux celtiques à forme d'animaux* (Paris, 1906). For the Welsh bards: Walter, *Das alte Wales* (Bonn, 1859); Stephens, *Literature of the Kymry* (London, 1873). For the Irish bards: Thurneysen, *Mittelirischen Verslehren*, in Stokes and Windisch's *Irische Texte*, vol. iii (Leipzig, 1880-1900); Douglas Hyde, *A Literary History of Ireland* (New York, 1906); Hull, *Irish Literature*, vol. ii (London, 1908). Among older treatises, Jones, *Relics of the Welsh Bards* (London, 1784), and Walker, *Memoirs of the Irish Bards* (London, 1786), may be cited.

BARD, or BARD'ING (Sp., Port. *albarda*, pack saddle, from Ar. *al-barda'ah*, a wooden pad placed under the saddle). The armor used for the protection of a horse; almost always used in the plural, bards or bardings. See **CHAMFRON**.

BARD. A village in north Italy, on the Dora Baltea River and the Turin-Aosta Railway, 51 miles north of Turin (Map: Italy, B 2). Near it and over the railway tunnel, at a height of nearly 1300 feet, towers Fort Bard, which commands the road over the Great and Little St. Bernard into the plains of Piedmont. It was built in the eleventh century, was seized by the French during the War of the Spanish Succession in 1704, and in 1800 was destroyed by them

after it had been defended by 400 Austrians who held Napoleon in check for a week before the battle of Marengo; it was afterward rebuilt. Pop. (commune), 1881, 437; 1901, 425; 1911, 390.

BARD, SAMUEL (1742-1821). An American physician. He was born in Philadelphia and was educated at Columbia College and the Edinburgh Medical School. He organized the medical school at Columbia College and became dean of the faculty. While New York was the seat of the Federal government, he was Washington's family physician. In 1813 he became president of the College of Physicians and Surgeons in New York. His published works comprise a study of the diseases of sheep, *The Shepherd's Guide* (1807); a treatise on *Angina Suffocativa*, and a *Manual of Midwifery* (1807). Consult John McVickor, *Life of Samuel Bard* (New York, 1822).

BARDAISAN, bär'dt-sän'. See BARDESANES.

BARDEEN, CHARLES WILLIAM (1847-). An American educator and editor, born at Groton, Mass., and a graduate of Yale University in the class of 1869. For three years before entering college he served in the Civil War, with the First Massachusetts Volunteers. After filling several less important educational positions, he was made (1872) superintendent of schools at Whitehall, N. Y. Two years later he became editor and publisher of the *School Bulletin* and continued as such for many years. Identifying himself prominently with a number of educational and scientific societies, he held for six years (1900-06) the presidency of the Educational Press Association of America. His publications, dealing mainly with subjects related to his profession, include: *Manual of School Law* (1875); *Some Facts about our Public School System* (1878); *Teaching as a Business for Men* (1885); *Organization and System Versus Originality* (1890); *The Song Budget Series Combined* (1894); *Geography of the Empire State* (1895); *Some Problems of City School Management* (1899); *Dictionary of Educational Biography* (1901); *The Woman Trustee* (1905); *Educational Journalism for the Past Fifty Years* (1906); *Fables for Teachers* (1909); *Tom and Tom Tit* (1911); *The Yellow Streak, and Other Stories about Schools* (1912).

BARDELEBEN, bär'de-lä'b'en, ADOLF VON (1819-95). A German surgeon, born at Frankfurt-on-the-Oder. He studied medicine in Germany and in France and in 1849 became professor of surgery at the University of Greifswald. During the War of 1866 he acted as surgeon general and in 1868 became professor of surgery in the University of Berlin. In 1870 he again acted as consulting military surgeon. His published works include an excellent *Lehrbuch der Chirurgie und Operationslehre* (1852; 8th ed., 4 vols., 1879-82).

BARDELL', MRS. A widow in Dickens's *Pickwick Papers*. She is plaintiff in the famous case of Bardell v. Pickwick. After the trial she is thrown into the Fleet Prison for inability to pay her lawyer's fees. See DODSON AND FOGG.

BARDESANES, bär'de-sä'nēz, or **BARDAISAN** (son of Daisan, a river) (154-c.223). A Syrian Christian poet and theologian. He was born at Edessa, of a good family, and lived for a time at the court of the Abgars. Our information concerning him is not extensive, and only fragments of his many writings have survived, but we know that he was a very influential

figure in the Syrian church. He died at Edessa c.223. It was chiefly through his efforts that Christianity was first introduced into Edessa, which soon became an important theological centre. He fled into Armenia when Edessa was taken by Caracalla (217), but returned soon afterward. Writers like Eusebius and Jerome refer to Bardesanes in high terms, although the former represents him as having been for a time a Valentinian Gnostic. See VALENTINUS; GNOSTICISM. He popularized his views in the form of hymns, 150 in number, which were widely used and which justify us in regarding Bardesanes as one of the fathers of Christian hymnology. It is uncertain how much his son, Harmonius, contributed toward this enrichment of worship, but some ancient authorities rate his services very high. Ephraim, the Syrian, an orthodox writer of the fourth century, was alarmed at the influence these hymns still exerted in his day, so he composed others in their place, using Bardesanes as a model, but inserting nothing that was not strictly Catholic. It is difficult to decide just how far Bardesanes' teachings diverged from orthodoxy. He himself denied the charge of polytheism which was brought against him.

The book of *Laws of Countries*—*Cureton, Spicilegium Syriacum* (London, 1855), and the *Ante-Nicene Fathers*, vol. viii, pp. 723 ff. (New York, 1895)—is not the work of Bardesanes, as some have thought, but comes from one of his school and reflects his views. For the early references to Bardesanes consult Harnack, *Geschichte der altchristlichen Litteratur*, vol. i (Leipzig, 1893); for monographs on Bardesanes (in German), Hahn (1819), Merx (1863), and Hilgenfeld (1864). Consult in general, Hort, "Bardaisan," in Smith and Wace, *Dictionary of Christian Biography* (London, 1887).

BARDI, bär'dé, BARDO DE'. A blind scholar in George Eliot's novel, *Romola*. He is the father of the heroine.

BARD OF A'VON. A frequent title of Shakespeare, from his home at Stratford-on-Avon.

BAR/DOLPH. One of Falstaff's followers in Shakespeare's *Henry IV*, *Henry V*, and *The Merry Wives of Windsor*. He is, first, corporal, then lieutenant in his leader's "ragged regiment," everywhere conspicuous for his red nose.

BARDOUX, bär'dōō', AGÉNOR, pen name Agénor Brady (1830-97). A French politician and author, born at Clermont-Ferrand. He studied law in Paris and in 1871 was elected to the National Assembly. In 1876 he was elected to the Chamber of Deputies and from 1877 to 1879 was Minister of Public Instruction. He was elected a permanent Senator in 1882. He wrote *Les légistes et leur influence sur la société française* (1877), *Le comte de Montlosier et le gallicanisme* (1881), *La bourgeoisie française* (1886), *Chatcaubriand* (1893), and *Guizot* (1894).

BARDOWIEK, bär'dō-vēk. A town in the province of Hanover, Prussia, on the Ilmenau River, 3 miles north of Lüneburg. In 1189, when it was destroyed by Henri the Lion, it ranked as the principal commercial centre of north Germany. The region is fertile, and Bardowiek is a centre for trade in farm products. Ruins of a cathedral of splendid proportions exist, incorporated with a fourteenth-century Gothic church. Pop., 1900, 2002; 1910, 2200.

BARD'SEN, IVAR (c.1300-c.1350). A Greenland magistrate. He was born in Oster Bygd,

or the East District of Greenland, and held the position of steward under the Bishop of Gardar. In 1339 he was sent with several vessels to relieve the sister colony of Vester Bygd, or the West District, which had been invaded by the Eskimos. The manuscript of his account of this expedition, with sailing directions, was found many years later in the archives at Copenhagen and was subsequently translated into various languages. The first English translation seems to have been made for Henry Hudson. Danish, Latin, and English versions may be found in Major's *Voyages of the Venetian Brothers, N. and A. Zeno* (1873), and an English version, with the original text, was published by the Hakluyt Society in 1873. Consult B. F. De Costa, *Sailing Directions of Henry Hudson, Prepared for his Use in 1608 from the Old Danish of Ivar Bardsen* (Albany, 1869).

BARDSTOWN. A city, and the county-seat of Nelson Co., Ky., 39 miles by rail south by east of Louisville, on the Louisville and Nashville Railroad (Map: Kentucky, E 4). It contains the St. Joseph's College (Roman Catholic) and Bethlehem Academy. The city is a shipping point for hogs, cattle, grain, and whiskey, and has distilleries, flouring and saw mills, and cooperage, and manufactures chairs, brooms, and concrete. The water works and light plant are owned and operated by the city. Pop., 1900, 1711; 1910, 2126.

BARDWAN, bārd-wān' (Pers. formerly *Wardhamana*, the thriving, growing one). A city on the Damoda River, in the district and division of Bardwan, Bengal, British India, on the Grand Trunk Railroad from the Hugli to the northwest, in lat. 23° 12' N. and long. 87° 56' E., 74 miles from Calcutta (Map: India, E 4). It is a miserable place—an aggregate of second-rate suburbs—but contains numerous temples and a large palace. Pop., 34,500. The division of Bardwan has an area of 13,850 square miles. Pop., 1891, 7,689,300; 1901, 8,245,000.

BARE, bā'rā. An important group of tribes of Arawakan stock, occupying the upper Rio Negro in northwestern Brazil and the Casiquiare, Guaina, and Atabapo in the adjacent region of Venezuela. They are said to be absorbing the neighboring tribes, so that within the last century their language has become general throughout a wide area. Their centre is still the settlement of San Carlos, and according to Dr. Koch-Grünberg (1911) "they form the nucleus of the modern civilized Indian population of the greater part of the Rio Negro."

BAREA, bā'rā-ā (Abyss. slaves). The name of a negro tribe living in the mountains north of Abyssinia. They have suffered greatly from the continual raids of slave traders and are now much reduced in number. An account of this people is given in Munzinger's *Ostafrikanische Studien* (Schaffhausen, 1864), and a grammar of their language was published (Vienna, 1874) by Reinisch, who utilized Munzinger's manuscript collections. See AFRICAN LANGUAGES.

BARE'BONES, or **BARBON**, PRAISE-GOD (c.1596-1679). A London tanner, and member of the Parliament of 1653, who became known by his name. In 1660 he headed a procession of people to protest against the restoration of Charles II, and in consequence spent some time in the Tower in 1662. He had been chosen minister of a Baptist congregation shortly after 1630 and became very popular as a preacher.

BAREBONES PARLIAMENT. A name

in derision applied to Cromwell's "Assembly of Nominees," from one of its members, the tanner, Praise-God Barebones. This Parliament was composed of 140 members selected by the general-in-chief and the council of the army from lists of nominees submitted by the Congregational churches in each county. It met on July 4, 1653; and Cromwell, in a long speech, impressed upon its members their responsibility as godly men. It was expected, apparently, to perform the functions of a kind of constituent convention, preparing the way for the election of a regular parliament into whose hands it was to resign its authority. Much ridicule has been cast upon it for its alleged unpractical character. Its attempt to abolish tithes and the Court of Chancery, without providing proper substitutes, has been especially criticised. As a matter of fact, it was a very respectable body, containing many able men. Several very wise measures were enacted. Among these was an ordinance providing for the civil-marriage celebration before justices of the peace and for civil-marriage registration by elected parish registrars. Its provisions were in harmony with the contemporary laws of the New England Colonies and anticipated the essential principles of the present English system by nearly 200 years. But the Assembly attempted constitutional legislation which Cromwell regarded as beyond its province; and so, on Dec. 12, 1653, the majority of its members placed their resignation in his hands. Consult: H. A. Glass, *The Barebone Parliament* (London, 1899); C. H. Fisch, *Oliver Cromwell* (New York and London, 1900); Gardiner, *History of the Commonwealth and Protectorate*, vol. ii (New York, 1903); Trevelyan, *England under the Stuarts* (London, 1904).

BAREFOOT'ED (in Lat. *discalceati*, shoeless). An appellation given to certain monks and nuns who abstain from wearing any covering on the feet, either entirely (as the Alcantarines, who originated at Placentia, in Spain, in 1540), or for a specified period of the year (as the nuns of Our Lady of Calvary); or who, instead of shoes, wear merely sandals, i.e., soles of wood, leather, rope, or straw fastened by thongs. They do not constitute a separate order in the Roman Catholic church, but are to be found as representing a higher grade of asceticism with more or less severity of observance, among most of the orders, Carmelites, Franciscans, Augustines, Eremites, Capuchins, etc. This form of religious austerity is to be traced generally to the custom which prevailed among the Jews and Romans of putting off their shoes on the occurrence of public calamities, that in this condition of mourning and humiliation they might implore the Divine Being for deliverance; but perhaps more particularly to the command which Christ gave his disciples (Matt. x. 10; Luke x. 4).

BARÈGE, bā'rāzh'. A fabric of mixed yarns, gauze-like in texture, adapted for women's dresses, called in France *crêpe-de-barège*. The name is derived from the valley of Barèges, where they were first manufactured, the seat of the manufacture at present being at Bagnères de Bigorre. Barèges are usually a mixture of silk and worsted; an inferior kind being composed of cotton and worsted. They vary in color and are sometimes light in tint, with printed patterns. All are of light weight for summer wear. The best are manufactured in France.

BARÈGES, 'or **BARÈGES-AUX-BAINS**, ô'bān'. A watering place in the department of

Hautes-Pyrénées, France, picturesquely situated in the valley of the river Bastan, 4000 feet above sea level, 24 miles south of Tarbes. It consists of a single street of some 80 houses, running along the narrow, rugged glen. The springs are considered efficacious for rheumatism, scrofula, and old wounds. The bath establishment is a fine marble building. Other prominent institutions are the Military Hospital and the Ecclesiastical Charity Hospital of Sainte Eugénie. Extreme cold and the danger of frequent avalanches almost depopulate the town in winter.

BAREILLY, bà-rā'lê, or **BARELI**. The capital of the Bareli district in the Rohilkhand division of the United Provinces, British India (Map: India, C 3). It is in lat. 28° 23' N., and long. 79° 28' E., 152 miles east of Delhi. It is pleasantly situated in a well-wooded country on the left bank of the Juâ, an affluent of the Ramganga, but possesses few structures of architectural beauty. Besides a brisk and lucrative commerce in grain, cotton, and sugar, the octroi on which is the chief source of municipal revenue, it has considerable manufactures, more particularly of ornamental chairs and tables. It is the seat of a well-attended government college and has a military cantonment. Bareilly became notorious during the mutiny of 1857 by the massacre of Europeans on the 31st of May. It was recaptured by Sir Colin Campbell, afterward Lord Clyde, in May, 1858. Pop., 1891, 121,000; 1901, 117,400; 1911, 129,462.

BARENTS, bà'rènts, WILLEM (?-1597). A Dutch explorer of the Arctic Ocean. He sailed from Holland in June, 1594, to find a northeast route to China, and explored a great part of Nova Zembla. In May, 1596, he went as pilot of two ships sent out by the city of Amsterdam. At Spitzbergen the ships separated, and Barents guided one of them around Nova Zembla. At Ice Haven it was frozen in, and here Barents and his companions were forced to remain for months, suffering terribly from the intense cold. Many of the crew died in the course of the winter. On June 14, 1597, the survivors started in open boats for the mainland. Barents and four of his companions soon succumbed, but the rest reached Lapland, where they found the other vessel and were rescued. Interesting relics of this expedition were discovered in 1871 by Captain Carlsen; they were found undisturbed after a lapse of 274 years. Consult Gerrit de Veer, *The Three Voyages of Willem Barents*, published by the Hakluyt Society (London, 1876).

BARÈRE DE VIEUZAC, bà'râr' de vyê'zâk', BERTRAND (1755-1841). A member of the French National Convention. He was born at Tarbes and practiced law at Toulouse. After acting as deputy in the States-General and editing a daily Revolutionary paper, *Le Point du Jour*, he was sent, in 1792, to the National Convention by the department of Hautes-Pyrénées. His eloquence was so poetical that he came to be known as "the Anacreon of the guillotine." He was reporter from the committee on war, where he sat with Danton, and presided over the convention when sentence was passed on Louis XVI, rejecting the King's appeal to the people, with the words, "The law is for death, and I am here only as the organ of the law." His inborn mildness warring with the instinct of self-preservation made him alternately a supporter of merciful measures and a bloodthirsty advocate of the guillotine; but his entire public career indicates a man of essential cowardice, far more

selfish than patriotic. After the fall of Robespierre, whom he helped to overthrow, Barère proposed the continuation of the Revolutionary Tribunal, but was denounced, impeached, and sentenced to transportation. He was saved, however, by the general amnesty after the 18th Brumaire. Elected as deputy during the Hundred Days, he was banished after the second Restoration, and devoted himself to literary work at Brussels, till the Revolution of July permitted his return. In 1832 he was once more elected as a deputy from the Hautes-Pyrénées. His election, however, was annulled on account of errors in form, whereupon the government gave him an official position in his department, which he held till 1840. His *Mémoires*, which were published at Paris in 1834, have been translated into English by Payne (London, 1896).

BARETTA - WORMS, bà'rê'tâ' vôrms', BLANCHE ROSE MARIE HÉLÈNE (1856-). A French actress, member of the Comédie Française. She was born at Avignon and entered the Conservatoire when only 12 years old, leaving it in 1872 with a second prize in comedy. After engagements at the Odéon and the Vaudeville she made her début at the Théâtre Français in 1875, as Henriette in *Les femmes savantes*, and the next year became a member of the company. Among her successes there have been her performances in *Le mariage de Victorine*, *La maîtresse légitime*, *Le fils naturel*, *Les corbeaux*, *Antigone*, *Le gendre de Monsieur Poirier*, and *Le jeu de l'amour et du hasard*. She was married to M. Worms, a colleague at the Théâtre, in 1883.

BARETTI, bà-rê'ttê, GIUSEPPE MARC' ANTONIO (1719-89). The most important Italian critic of the eighteenth century, well known in England for his friendship with Reynolds, Burke, and Dr. Johnson and for his English works. After a roving life through the literary centres of Italy, he settled as a teacher of Italian in London (1751) and gave impetus to Italian studies by his many friendships and by his *Dissertation on Italian Poetry* (1753), his *Italian Library* (1757), and by his Italian grammar and dictionary (1753, 1760). In 1760 he returned to Italy as a private tutor, leaving a charming narrative of the journey in his *Lettere familiari*, published also in English, *A Journey from London to Genoa* (1770). In Venice (1763-64) he edited, under the pseudonym of Aristarco Scannabue, the *Frusta letteraria*, or 'Literary Scourge,' his most serious work, in which he attempted to thrash Italian letters into more serious channels. Again, in England in 1765, he published an *Account of the Manners and Customs of Italy*, and a *Discours sur Shakespeare et M. de Voltaire* (1777), in which he warmly defended the English dramatist. Soon after his return he killed a man in a street brawl, was tried for murder, and acquitted. In his later years, which he passed almost entirely in England, he acted as secretary of the Royal Academy and at one time rejected a professorship at Oxford. As a critic, Baretti stimulated the mutual understanding between England and Italy. He was singularly free from many of the cant prejudices of his contemporaries in Italy, especially in regard to academic literature. His literary taste in many of its aspects was a century ahead of his time. Yet his work is more of impulse, with moments of inspiration, than of profound penetration into the underlying principles of criticism. Consult L. Colli-

son-Morley, *G. Baretta with an Account of his Literary Friendships* (London, 1909), and B. Croce, *Problemi di estetica* (Bari, 1910). Selected works were published at Bari (1911 and afterward), edited by L. Piccioni, the leading authority on Baretta's life and works.

BARFLEUR, bär'flær' (projection on the channel, from Gael. *barr*, Scand. *bard*, projection, summit + Teut. *fleot*, *fliez*, flush of water, canal, Ger. *Fluss*, Dutch *vliet*, AS. *fléot* = Eng. fleet, a river). A seaport and summer resort in the department of La Manche, France, 16 miles east of Cherbourg (Map: France, N., D 3). There is good sea bathing, and some trade in timber and fish. Up to the time of Henry IV of England it was strongly fortified and a port of arrival from England. Pop., 1901, 1210; 1906, 1274; 1911, 1238.

BARFOD, bär'föd, PAUL FREDERIK (1811-96). A Danish historian, born at Lyngby (Jutland). In 1848-49 he was a member of the Constitutional Assembly, subsequently also of the Folkething, and an official in the Ministry of the Interior. In 1866 he became an assistant in the Royal Library at Copenhagen. He was an advocate of Scandinavian unity. His principal work is *Fortællinger af Fædrelandets Historie*, 'Tales from the History of the Fatherland' (4th ed., 1874).

BARFURUSH, bär'fū-rōosh'. See BALFRUSH.

BARFUSS, bär'fōos, HANS ALBRECHT, COUNT (1635-1704). A Prussian field marshal, born at Mögeln (Brandenburg). He first became prominent in 1678 as a colonel in the war against Sweden, and in the war against the Turks won much distinction as commander of the left wing at the storming of Buda in 1686. With an auxiliary force of 6000 he took a prominent part in the victory over the Turks at Slankamen (1691). Subsequently he was active in various cabals of the court, until expelled through the influence of his rival Von Wartenberg.

BAR/GAIN (OF. *bargaigner*, to chaffer, LL. *barcamare*, to traffic, change about, from *barca*, bark, boat for traffic) **AND SALE**. A mode of conveying lands at common law, owing its efficacy to the Statute of Uses (q.v.). Technically the transaction was a bargain, or agreement, on the part of the vendor (hence called the *bargainor*), which amounted to a declaration of trust in favor of the purchaser (known as the *bargainee*), and which, being a "dry" or passive trust, was thereupon executed by the force of the statute, transferring the title of the property from the former to the latter. It was essential to the efficacy of a bargain and sale that it should be based upon a valuable consideration, in order that it should operate to create a trust or to transfer the legal title to the lands affected thereby. The correlative transaction, where such a bargain or declaration of trust was made without a material consideration to a blood relation of the vendor, was known as a *covenant to stand seised* to the use of the latter. This was said to be based on the consideration of blood and affection, and was described as a "good," as distinguished from a "valuable" consideration. It is to the prevalence of these forms of conveyance—which were by no means the only methods by which lands could be conveyed—that we owe the general but erroneous belief that a conveyance of lands not made to a relative of the grantor always requires a valuable consideration. The ancient conveyance by feoffment or livery of seisin (qq.v.) was

effective without an actual or pretended consideration, and there is no sufficient reason to doubt that this is equally true of the modern conveyance by grant (q.v.). The caution of lawyers, however, has kept alive the practice of reciting a consideration in deeds of all kinds. In order to avoid the registration of a deed of bargain and sale required by the Statute of Enrollments (27 Hen. VIII, c. 16, 1535), the modern deed of *Lease and Release* was invented, which was in effect a bargain and sale of the lands to be conveyed, for a year, followed by a release (q.v.), or quitclaim (q.v.), by the vendor of his reversionary estate as landlord. In this form the conveyance by bargain and sale was the usual mode of transferring the title to lands in England for 300 years, and in the United States until the enactment of statutes during the last century substituting the more direct and convenient deeds of grant now generally in use. Deeds of bargain and sale and of lease and release, though infrequent and no longer necessary, may still be used. Consult: Blackstone, *Commentaries on the Laws of England*; Williams, *Principles of the Law of Real Property*, 17th International ed. (London, 1892; Boston, 1894); Tiffany, *The Law of Real Property* (St. Paul, 1903).

BARGE/BOARD (cf. LL. *bargus*, a sort of gallows). In wooden domestic architecture in England, and later in Switzerland, when the roof projects considerably over the wall of a house, the gable is generally furnished along its edge with a board which either covers a rafter or occupies the place of a rafter itself. These bargeboards were often very richly ornamented, particularly in the fourteenth and fifteenth centuries. They are sometimes termed *Vergeboards*.

BARGÈS, bär'zhès', JEAN JOSEPH LÉANDRE (1810-96). A French Orientalist. He was born at Auriol (Bouches-du-Rhône) and was educated at Marseilles. He was ordained to the priesthood in 1834 and three years afterward was appointed to the chair of Arabic at Marseilles. In 1842 he became professor of Oriental languages at the Faculty of Theology at Paris, which position he occupied until the suppression of that faculty in 1885. Among his numerous publications are the following: *Temple de Baul à Marseille, ou Grande inscription phénicienne*, etc. (1847); *Aperçu historique sur l'Eglise épiscopale de Tlemcen* (1848); *Hébron et le tombeau du patriarche Abraham* (1865); *Vie du célèbre marabout Cidi Abou Medic* (1884); *Recherches archéologiques sur les colonies phéniciennes établies sur le littoral de la Cetto-lagurie* (1878); *Notre-Dame des victoires pendant la Commune* (1889).

BAR/GHEST. A horrible goblin, with large teeth and claws, fabled to appear in the form of a huge dog or bear. Its appearance to any one is taken to portend imminent death or grievous misfortune. The barghest is still fancied to exist in the northern part of England. As to the origin of the name, opinions differ widely. The latter part, *ghest*, would seem to be identical with the German *Geist*, English *ghost*. Some think that "barghest" is for *berg-geist*, 'mountain demon'; others refer it to *Bär*, 'bear,' in allusion to its supposed form.

BARGIEL, bär'gèl, WOLDEMAB (1828-97). A German composer and teacher of music. He was born and died in Berlin. He studied music in Leipzig under Moscheles, Hauptmann, and Gade,

and in 1850 began to teach in Berlin, where he made a reputation by publishing pianoforte and orchestral works. In 1859 he was made professor at the Conservatory of Cologne; in 1865 kapellmeister and director of music in Rotterdam, and in 1874 became professor in the Hochschule für Musik in Berlin. Bergiel was a devoted follower of Schumann (he was a step-brother of Clara Schumann), and his works, though not numerous, are highly esteemed. He is best known by his overtures to *Medea* and *Prometheus*, and by his two choruses for female voices, *Spring Night* and the *XXIII Psalm*. Consult J. A. Fuller-Maitland, *Masters of German Music* (London, 1894).

BARHADAD I. King of Damascus, son of Tabrimmon. He reigned c.885-844 B.C. He was the ally of Asa of Judah (c.933-877) against Israel, and he fought against Ahab (c.872-851) with varying success. On the other hand he seems to have been able to cope with Shalmaneser III (860-825), both at Karkar in 854 and in 849-848. The Assyrian inscriptions refer to him as IM'idri, which may be read either Biridri or Adad-idri, and the Hebrews as Ben Hadad. But the Zakir inscription published by Pognon (*Inscriptions Semitiques*, Paris, 1907) shows that the name of the son of Hazael, also given by the Hebrews as Ben Hadad, was Bar Hadad. He was probably murdered by Hazael, who usurped his throne, according to 2 Kings viii. 9-15.

BARHADAD II. King of Damascus, son of Hazael. He reigned c.804-774 B.C. The inscription of Zakir, King of Hamath and Laash, speaks of Bar Hadad, son of Hazael, as "King of Aram." This settles the question of his name; Bar, 'son,' has been translated into Hebrew *ben*. According to Zakir, Bar Hadad led a coalition of several kings and cities against him, but failed to capture Hazrak. (See HADRACH.) In 803 he was obliged, after a siege of Damascus, to pay tribute to Adad-nirari IV of Assyria (812-783 B.C.). He was a contemporary of Joash of Israel and of Joash and Amaziah of Judah.

BARHAM, RICHARD HARRIS (1788-1845). An English humorist, known as "Thomas Ingoldsby." He was born in Canterbury, Dec. 6, 1788, and died in London, June 17, 1845. He began to study law, left it for the Church, and was ordained in 1813. In 1821 he was appointed minor canon of St. Paul's, London, and three years later became one of the priests in ordinary of His Majesty's Chapel Royal. In 1837 he began, in *Bentley's Miscellany*, the publication of the *Ingoldsby Legends*, a series of comic tales in irregular verse, by which he gained immediate fame as a humorist. Yet his life was grave and dignified, and he was held in high respect. Though a Tory in politics, he was the lifelong friend of Sydney Smith, the prominent Liberal; and Theodore Hook was also among his intimates. He published two novels, *Baldwin* and *My Cousin Nicholas*, and contributed largely to the *Edinburgh Review* and the *Literary Gazette*. "His sound judgment and kind heart made him the trusted counselor, the valued friend, and the frequent peacemaker; and he was intolerant of all that was mean, base, and false." For his biography, consult Barham, *The Life and Letters of the Rev. R. H. Barham* (London, 1880).

BAR HARBOR. See MOUNT DESERT.

BAR-HEBRAÛS (1226-86). A distinguished and prolific Arabic and Syriac writer.

His full name was Yuhanna Abulfaraj ibn Harun; as bishop he assumed the name of Gregorius. He was born at Malatia in Armenia, and from the fact that his father Aaron was a Jew by birth, or, at all events, of Jewish descent, the son became known as Bar-Hebraus, that is, 'son of the Hebrew.' Bar-Hebraus himself, however, was a Christian and an adherent of the Jacobite sect. At an early age he entered upon the study of Arabic and Syriac, as well as of philosophy, theology, and medicine, and acquired such distinction that he was known among his contemporaries as "the phoenix of the age." In 1243 he went to Antioch and commenced a monastic life; in 1246 he was made Bishop of Gubas (near Malatia) and the following year he was transferred to Lakabhin, another diocese adjacent to Malatia. There he remained until 1253, when he was transferred to Aleppo, though he did not assume full charge until 1258. In 1264 he was made *maphrian*, or catholicus, a position next in rank to that of the patriarch. He died at Maragha in Azerbaijan on July 30, 1286.

Despite the absorbing duties incident to the charge of a large diocese, Bar-Hebraus manifested an astonishing literary activity, ranging over history, theology, philosophy, grammar, and medicine. Among his theological works his critical and doctrinal commentary on the entire Bible, which he called the "storehouse of secrets," is the most important. Only portions of this compilation have been published. In the realm of philosophy he compiled an encyclopædic survey of the whole Aristotelian discipline, which he subsequently rewrote in an abridged form. Best known is his great chronicle of universal history, written in Syriac. Beginning with Adam, it is brought down to his own days. The first part of it, containing the history down to the establishment of the Church, was published in Leipzig in 1789 by Bruns and Kirsch, and again, in a better edition, by Bedjan (Paris, 1890). The second and third parts, dealing respectively with the patriarchate of Antioch and the eastern branch of the Church, were published by Abbeloos and Lamy (3 vols., Paris and Louvain, 1872-77). This work was rewritten by Bar-Hebraus in an abridged form in Arabic and published under the title of *History of Dynasties*, by Pococke, with a Latin translation, Oxford, 1663, and again at Beirut, 1890, by Salhani. His grammatical treatises, which are exceedingly valuable, were published by Abbé Martin in 1872 (*Œuvres grammaticales d'Aboul Faradj dit Bar Hebraus*, 2 vols., Paris, 1872). Besides this, there are numerous medical treatises, mostly unpublished, as well as astronomical and cosmographical writings, and also a number of poems and tales. On his commentary to the Bible, consult Göttberger, *Barhebraus und seine Scholien zur Heiligen Schrift* (Freiburg, 1900).

BARI, bâ'rê. An archiepiscopal city and flourishing seaport on the Adriatic, the capital of the province of Bari delle Puglie, south Italy (Map: Italy, L 6). It is on the Bologna-Brindisi Railway, 69 miles northwest of Brindisi. The old part of the town, which is on the tongue of land that divides the old harbor from the new, has narrow, crooked, gloomy streets. The new part of the town is on a rectangular plan, with broad avenues, squares, and gardens. The most interesting building is the church and priory of St. Nicholas, founded in 1087, and fin-

ished in 1139 by King Roger, a Norman. It was here that Pope Urban II in 1089 assembled a council of Greek and Latin bishops to discuss the theological differences that divided the East and the West. The building contains the splendid mausoleum of Bona Sforza, Queen of Poland and Duchess of Bari, who died here in 1558. In a vault under the silver altar in the crypt lie the bones of St. Nicholas, from which is said to exude a fluid, *manna di San Nicola*, which heals miraculously. The Saint's festival, on the 8th of May, is attended by thousands of pilgrims. The cathedral, which dates from the first part of the eleventh century, was spoiled by repairs made in the eighteenth. Its dome was renovated in 1905, and other alterations made. It contains paintings by Paolo Veronese, Tintoretto, and Calabrese. The church of St. Gregory, an eleventh-century edifice and the old palace chapel of the Byzantine Governor, is very interesting. The castle, built in the twelfth century, is now used as a prison and signal station. Bari also has a seminary, a lyceum, the Ateneo, containing a technical school and a provincial museum, a casino, a theatre constructed by Antonio Niccolini, and fine public squares and gardens. In the Piazza Umberto I there was erected in 1905 a monument to King Humbert. The new harbor is accessible to the deepest ships, and the town enjoys a growing maritime trade. There is regular steamboat communication with Venice, Ancona, Trieste, Brindisi, Genoa, and Marseilles. Bari manufactures organs, pianos, mirrors, furniture, candles, soap, oil, and cordials, and has an extensive commerce in oil, wine, almonds, saffron, grain, fruit, cotton, and wool. The United States and other countries are represented by consular agents. Pop., 1881, 61,500; 1901, 77,478; 1911, 103,168.

The importance of *Barium*, Gk. *Βάριον*, *Barion*, in the third century B.C. is shown by its coins. Horace wrote of the *Barii mania piscosi*. In the Middle Ages Goths, Greeks, Franks, Saracens, Lombards, Venetians, and Normans fought for the possession of it. Bari was an independent duchy from the fourteenth century until it was united with the kingdom of Naples.

BARI. A negro tribe living on the White Nile, near Gondokoro. They practice agriculture to some extent, but their chief occupation is the raising of cattle. They are a warlike people and offered a stout resistance both to the slave traders and to the Egyptians, until they were subdued by Baker Pasha in 1871. The Bari are very tall and finely formed. Both sexes shave the hair and paint the body red. Consult Kaufmann, *Schilderungen aus Centralafrika* (Brixen, 1862), and for a grammar of their language, Mitternutter (Brixen, 1867). See AFRICAN LANGUAGES.

BARIE, *bār'è* (Gk. *βάρυς*, *barys*, heavy). The unit of pressure in the C. G. S. system (q.v.) adopted by the International Congress of Physicists at Paris in 1900, and corresponding to a pressure of 1 dyne to the square centimeter. The practical unit of pressure is the *megabarie*, or a pressure corresponding to a megadyne (10^6 dynes) to the square centimeter, and very nearly equivalent to the pressure of 75 centimeters of mercury. The *megabarie* is also a useful unit in that it corresponds approximately to the pressure of 76 centimeters of mercury under normal condition, or "1 atmosphere." This pressure is equal to 1.0133 megabaries. See MECHANICAL UNITS.

BARILI, *bà-rè'lè*. A town on the west coast of Cebu, Philippines, 27 miles west of Cebu, the capital of the province (Map: Philippine Islands, D 5). Pop., 1903, 31,617.

BARILLA (Sp. *barrilla*, impure soda). A crude sodium carbonate obtained from the ashes of marine plants, which were formerly raised for that purpose in Spain, Sicily, Sardinia, the Canary Islands, and the Levant. The seeds were usually sown at the close of the year, and in the following September the plants were ready for cutting. A month later the barilla was obtained in the following manner. Holes were dug in the earth, capable of holding one or two tons of the soda, iron bars were laid across the cavities, and the dried plants, mixed with reeds, were placed upon them and burned. The molten mass containing the alkali dropped into the pit beneath. The operation was continued until the pits were filled, after which they were covered with earth. When sufficiently cool, the barilla was ready for shipment. The crude soda contained about 20 per cent of alkali, together with sodium, calcium, and aluminum chlorides and sulphates, with a little sulphur. It was formerly much used for the manufacture of soap, but since the introduction of the improved process for manufacturing soda from salt, its production has declined. *British barilla* is the name sometimes given to kelp.

BARING, *bā'ring*, or *bar'ing*. The firm of Baring Brothers was long one of the greatest commercial houses in the world. Its founder was John Baring, a German, who settled in a small business in Exeter, England, in the first half of the eighteenth century. Two of his sons, Francis and John, established in London in 1770 a banking house. In November, 1890, owing to the continued failures of the Argentine Republic to pay the interest due upon its debt, which had been guaranteed by the Barings, the firm was threatened with suspension, but was saved by the action of the Bank of England, which, in conjunction with the firm of Brown, Shipley & Co., advanced the sum of £13,000,000 to tide over the crisis. The house of the Barings has since been reorganized as a limited company for carrying on a regular banking business, though on a less extensive scale than before.—SIR FRANCIS BARING (1740-1810) became a director of the East India Company, and being a staunch supporter of Pitt, was created a baronet by that minister in 1793. He took an active part in the discussions relative to the Bank Restriction Act of 1797.—SIR THOMAS BARING (1772-1848), eldest son of the above, succeeded his father in the baronetcy. He was a member of the Commons in 1830-32. He appears to have taken no active part in the business of the firm and is known chiefly as an admirer and encourager of art. His magnificent collection of paintings was dispersed by public sale after his death.—SIR FRANCIS THORNHILL BARING (1796-1866), son of Sir Thomas, whom he succeeded, was educated at Oxford. He entered the Commons for Portsmouth in 1826, and under successive Whig governments was Lord of the Treasury, Secretary to the Treasury, Chancellor of the Exchequer, and First Lord of the Admiralty. He was created Baron Northbrook in 1866.—THOMAS BARING (1799-1873), another son of Sir Thomas, devoted himself early to commercial pursuits, and also to politics, siding with the Tories, contrary to the traditions of his family. He was,

however, much more widely known as the principal manager of the firm of Baring Brothers than as a politician.

BARING, ALEXANDER, first BARON ASHBURTON (1774-1848). An English financier and statesman. He was born in London, Oct. 27, 1774, the second son of Sir Francis Baring. For many years he was commercially engaged in the United States and Canada in the service of the great London mercantile house founded by his father. While in this country he married, Aug. 23, 1798, Anne Louisa, eldest daughter of William Bingham, of Philadelphia, United States Senator; and to his alliance and to his American mercantile acquaintance he was much indebted in later life. On the death of his father, in 1810, he became the head of the firm of Baring Brothers & Co., and in 1812 was elected member of Parliament for Taunton. In the first administration of Sir Robert Peel (1834-35) he was president of the board of trade and master of the Mint, and was created Baron Ashburton by patent in April, 1835. In 1842 Lord Ashburton's knowledge of business and thorough acquaintance with American institutions, customs, and modes of thought caused him to be appointed special Ambassador to the United States to settle the Northwestern Boundary Question and other disputes, which then threatened to involve the two countries in war. In August of the same year he concluded the famous Treaty of Washington, commonly called the Ashburton Treaty, by which the frontier line between the State of Maine and Canada was definitely agreed to. By this treaty seven-twelfths of the disputed ground and the British settlement of Madawaska were given to the United States, and only five-twelfths of the ground to Britain; but it secured a better military frontier to Britain and included heights commanding the St. Lawrence which the award of the King of Holland, who had been chosen arbiter, had assigned to the Americans. By the eighth and ninth articles provision was made for putting an end to the African slave trade, and the tenth article provided for the mutual extradition of suspected criminals. As an English statesman, Lord Ashburton opposed free trade, but strongly supported the penny-postage system when first proposed by Rowland Hill in 1837. His death took place May 13, 1848.

BARING, EVELYN, first VISCOUNT CROMER. See CROMER.

BARING, MAURICE (1874-). An English author and journalist. He received his education at Trinity College, Cambridge, and subsequently entered the diplomatic service in which he held various posts, being attaché to the British Embassy in Paris in 1898, Copenhagen in 1900, and Rome in 1902. From 1904 to 1909 he acted as special war correspondent for the *Morning Post* in Manchuria, Russia, and Constantinople. His writings comprise novels, essays, narratives, and poems, including *Hildeheim and Quatre Pastiches* (1899); *The Black Prince* (1892); *Gaston de Foix* (1903); *With the Russians in Manchuria* (1905); *Mahasena* (1905); *Desiderio* (1906); *Sonnets and Short Poems* (1906); *A Year in Russia* (1907); *Proserpine* (1908); *The Grey Stocking* (a comedy, 1908); *Russian Essays and Stories* (1909); *Orpheus in Mayfair* (1909); *The Story of Forget-me-not and Lily-of-the-Valley* (1909); *Landmarks in Russian Literature, Dead Letters, The*

Glassmender, Diminutive Dramas (1910); *Collected Poems* (1911).

BARING-GOULD, SABINE (1834-). A very versatile and prolific English author, born at Exeter. He studied at Clare College, Cambridge, and in 1864 was appointed curate of Horbury (Yorkshire). In 1871 he became rector of East Mersea (Essex) and in 1881 of Lew-Trenchard (North Devon). From 1871 to 1873 he was editor of *The Sacristy*, a quarterly review of ecclesiastical literature and art. His opera, *The Red Spider*, was produced in 1898. The list of his published works is large in number and diversified in range. Valuable are his studies in the superstitions, legends, and folklore of the Middle Ages, such being *The Book of Werewolves* (1865), *Curious Myths of the Middle Ages* (2d series, 1866-67), and *Curiosities of Olden Times* (1869). His contributions to theology include *The Origin and Development of Religious Belief* (1869-70), *Lives of the Saints* (15 vols., 1872-77), and *The Lost and Hostile Gospels* (1874). In 1880 appeared his *Mchalah*, a powerful though somewhat uneven and melodramatic story (new ed., 1913), followed by *John Herring* (1883-86; 1913); *Court Royal* (1886-88), and *The Broom Squire* (1896; 1913); *Bladys of the Steepcony* (1897; 1910); *Virgin Saints and Martyrs* (1900); *A Book of Ghosts* (1904); *A Memorial of Nelson* (1905); *The Book of the Rhine from Clero to Mainz* (1906); *A Book of the Pyrenees* (1907); *Cornish Characters* (1909); *Family Names and their Story* (1909; 1912); *Cormeall* (1910); *Cliff-Castles and Cave-Dwellings of Europe* (1911); *The Land of Teck* (1911); *Village Sermons to Simple Souls* (1912); new edition of the *Vicar of Morwenstowe* and of *Old Country Life* (1913).

BARINGO, bá-rin'gò. A lake in the East African Rift valley in lat. 0° 32' N. (Map: Congo Free State, G 2). It lies at an altitude of 3675 feet, covers an area of 193 square miles, and although it is without visible outlet its water is fresh. Near the east shore are four small islands, and a larger island in the centre of this lake is inhabited. It was discovered in 1883 by J. Thomson.

BA'RITE. Natural sulphate of barium, also known as barytes, and heavy spar. The chemical formula is BaSO₄; analysis, 65.7 per cent BaO and 34.3 per cent SO₃; specific gravity, 4.3 to 4.6; hardness, 2.5-3.5. It crystallizes in the orthorhombic system, occurs in laminated and massive forms, usually white, opaque to translucent in color, resembles calcite, but easily distinguished by its weight and the fact that it is not acted on by acids. The massive cleavable forms decrepitate readily by heating, which offers a method of separating the mineral from sulphides having the same specific gravity. It rarely occurs pure, being generally associated with silica, lime, iron, and very often contains a small percentage of galena. The commercial sources are usually residual deposits in clay caused by the differential weathering of the inclosing limestone, in which the mineral was originally deposited by replacement, and sometimes veins; it also occurs as a gangue mineral with metallic ores. The production in the United States, which is decreasing, amounted to 37,487 tons in 1912, and came from Missouri and the southern Appalachian States. The value of the ore at the mine varies from \$3 to \$4, and the finished product from \$12 to \$22, depending on the grade.

The chief use of barite is in the manufacture of paints as an adulterant of white lead and in the manufacture of lithophone. When used alone as a pigment for paint, it is not satisfactory, as its crystalline nature renders it too transparent. Its large use in the manufacture of white rubber goods is rapidly being replaced by lithophone; the advantage claimed for lithophone is that it aids in vulcanizing. Its use in the paper industry is also decreasing. Other uses are in the manufacture of wall paper, leather, asbestos cement, and artificial ivory. The carbonate and chloride are used in cement to prevent efflorescence on bricks by forming insoluble sulphates with the sulphuric acid in the lime. Lithophone consists of a double precipitate of barium sulphate and zinc sulphide produced by calcining barite with coal, resulting in the formation of barium sulphide with some barium carbonate, dissolving the barium sulphide in water, filtering, and adding a solution of sulphate of zinc to the filtrate causing the precipitation of barium sulphate and zinc sulphide. This precipitate is calcined, ground, washed, dried, and pulverized. The adulterants of lithophone are usually china clay and gypsum. For complete bibliography see *United States Geological Survey Report* on "Baryte" for 1912.

BARITONE. See BARYTONE.

BARIIUM (Neo-Lat. from Gk. *βαρύς*, *barys*, heavy; alluding to its high specific gravity). A metallic element isolated in 1808 by Sir Humphry Davy. It is not found native, but occurs chiefly as the sulphate in barite, as the carbonate in witherite, and in other minerals of a more complex composition; also in mineral waters, the ashes of certain plants, and in sea water. Metallic barium was first obtained by Davy, who decomposed its hydrate with a powerful voltaic battery and obtained an amalgam of barium and mercury. The mercury of the amalgam was expelled by heating in an iron crucible. The metal itself (symbol, Ba; atomic weight, 137.4) was described by Davy as "silver-white," and by Bunsen as "golden-yellow" in color, so that it is questionable as to whether chemically pure barium has ever been obtained. It is a slightly lustrous, somewhat malleable metal, which melts at a red heat, but cannot be distilled. Its specific gravity is from 3.5 to 4.

The compounds of barium are used for a variety of purposes. Its peroxide, BaO_2 , formed when the anhydrous monoxide is heated to a dull-red heat in a stream of oxygen, is used in the manufacture of peroxide of hydrogen. Barium peroxide may, further, be used as a bleaching agent as well as for preparing oxygen.

The monoxide of barium, called *baryta*, is found, in combination with carbon dioxide, as the mineral witherite, and in combination with sulphuric anhydride as the mineral barite, or heavy spar. It is prepared commercially by heating barium nitrate in a porcelain crucible or retort, or by igniting barium carbonate in the strong heat of a forge fire. It is a grayish white, extremely caustic, poisonous, and strongly alkaline mass, which finds its chief application in sugar refining, as it forms an almost insoluble compound with sugar when added to molasses or other saccharine solutions. Barium monoxide unites readily with water to form barium hydroxide.

Barium sulphate, the most important of the commercial salts of barium, is found native as

the mineral barite or heavy spar (also called cawk or caulk). It is found in England, as in Derbyshire and Shropshire; also on the continent of Europe, and in the United States at various localities, but chiefly in Missouri, Tennessee, North Carolina, and Virginia. See **BARITE**.

Barium chloride, made by treating the native carbonate, witherite, with hydrochloric acid, is used in chemistry as a reagent, in the preparation of the artificial sulphate or permanent white, and for preventing incrustation in boilers.

Barium nitrate is prepared commercially by dissolving the native carbonate in dilute nitric acid and crystallizing the barium nitrate. It is largely used in pyrotechny, in the preparation of green fires, and in the manufacture of explosive compounds, as a substitute for potassium nitrate.

Barium salts, when brought into a non-luminous flame, burn with a yellowish-green color.

BAR/JE/SUS. See ELYMAS.

BARK (akin to Sw. and Dan. *bark*, LG. *borke*; possibly related to AS. *beorgan*, Ger. *bergen*, to cover). The term "bark" is a very indefinite one, for it is applied to different structures. In general, it is a structure that appears upon stems of shrubs and trees, and to understand its relation to other structures the structure of the stem must be described. The stem consists of a central vascular cylinder, invested by a cortex, and this in turn overlaid by the epidermis. The two regions of the vascular cylinder are the wood ("xylem") and the bast ("phloem"), the latter forming the outside of the cylinder and surrounding the xylem. Between xylem and phloem there is a layer of active cells called the "cambium," which forms new xylem on one side (within) and new phloem on the other. As a result, the so-called "annual rings" of wood (xylem) are laid down on the outside of the xylem cylinder, and new bast (phloem) is laid down on the inside of the phloem cylinder. This means a continual increase in the diameter of the stem, and it is very seldom that the epidermis grows in proportion. As a consequence, it is usually sloughed off, and in the meantime a new protective structure has been developed.

Either the outermost layer of the cortex or some deeper one becomes a cambium, and since its function is to form cork cells it is called "cork cambium" ("phellogen"). This cambium forms at its outer surface layer after layer of cork cells, a tissue peculiarly resistant to water. If the cork cambium is formed deep within the cortex, all the cortical cells outside of it die, since they are cut off from the water and food supply in the plant.

The two applications of the term "bark" are now obvious. In the one case bark includes all the structures outside the cork cambium, i.e., the layers of cork and more or less dead cortical tissue. In the other case bark includes all the structures outside the cambium of the vascular cylinder, i.e., phloem, living cortex within the cork cambium, the cork cambium itself, the layers of cork, and the dead cortical tissue. When bark is stripped from a tree, the easiest cleavage is through the vascular cambium, leaving the wood (xylem) exposed; and hence this more inclusive use of the term "bark" is more common in this country. In this case the two regions are distinguished as

"outer bark" (outside the cork cambium), which is dead and dry, and "inner bark" (between the two cambiums), which contains some living cells.

The cork cambium is often renewed year after year, and two prominent kinds of bark are formed. In one case the successive cork cambiums form zones completely around the stem, and the cork is deposited in concentric layers, forming "ringed bark." The cork oak is a notable example of ringed bark in which there is a very great accumulation of cork. In the other case the successive cork cambiums, instead of passing completely around the stem, run into the next outer one, thus cutting out segments which loosen and flake off, forming "scaly bark," as in hickory, apple, etc.

Tanning. The bark of many trees is capable of being used for tanning, but that is preferred which particularly abounds in tannic acid. Oak bark is principally used in Great Britain. See **LEATHER**.

The barking of trees can be accomplished with facility only in spring. The tree being felled, the rough, external, lifeless parts of the bark are removed as useless; the smaller branches are cut into lengths of about two feet, and their bark is loosened by beating with a mallet and is easily taken off; the bark of the trunk and main branches is cut by a chisel-like instrument or with an axe into similar lengths, each of which is divided longitudinally and finally stripped off by the aid of mallets, chisels, etc. The bark is sometimes dried in sheds, being placed on narrow shelves or frames in such a way that there may be a free circulation of air about it; sometimes in the open air, when it is very generally made to rest in a sloping position against trunks of trees placed horizontally at a little distance from the ground, the larger pieces of bark being placed so as to protect the smaller both from sun and rain. Great care is necessary in the drying of bark, as it is much damaged if allowed to get moldy and is liable to suffer injury from rain or from the exposure of its inner surface to the sun.

Medicinal Barks. The principal barks used in medicine will be found noticed in separate articles. (See **ANDIRA** [cabbage bark, Surinam bark]; **ANGOSTURA BARK**; **EXOSTEMMA** [Jamaica bark, St. Lucia bark, Pitou bark]; **CASCARILLA** [cascarilla bark, Eleuthera bark]; **CINCHONA** [cinchona bark, Peruvian bark, Jesuits' bark, Arica bark, Calisaya bark, Carabaya bark, Huamalies bark, Huanuco bark, Jacn bark, Loxa bark, Maracaibo bark, ash bark, crown bark, silver bark, yellow bark, tan bark, etc.]; **CLOVE BARK**; **COPALCHE BARK**; **CULLAWAN BARK**; **WINTER'S BARK**.) When bark is mentioned without any prefix, it is always cinchona, otherwise called Peruvian or Jesuits' bark, which is intended. Other barks used medicinally include cinnamon, which is used chiefly for flavoring; granatum, the bark of the pomegranate, used to expel tapeworms (see **ANTHELMINTIC**); and *Prunus virginiana*, or wild cherry, an ingredient of many cough mixtures. *Rhamnus purshiana*, or *Cascara sagrada*, is an important derivative of the bark of that plant. *Ulmus*, or slippery elm, is the inner bark of *Ulmus fulva*. It contains a large amount of mucilaginous material and is used as a demulcent. *Viburnum prunifolium*, a valuable uterine sedative, is obtained from the bark of the plant. See **CINCHONA**.

BARK, or **BARQUE** (LL. *barca*, *barica*,

boat, probably dimin. of Gk. *βᾱρις*, *baris*, row-boat, Coptic *bari*, boat). A three-masted vessel, which is fore-and-aft rigged on the mizzenmast, the main and fore being square-rigged. A vessel of any kind, especially a sailing vessel of small size. The distinction between a *bark* and a *barkentine* is that the latter has only the foremast square-rigged, the main and mizzenmasts being fore-and-aft rigged.

BARKAL, bār'kāl, or JEBEL BARKAL.

An isolated mountain of sandstone in Nubia, near the Fourth Cataract of the Nile. It is situated about one mile from the river, is some two miles in circumference, and rises abruptly to the height of nearly 400 feet. The summit is flat, forming a broad plateau. In hieroglyphic inscriptions it is called "the holy mountain." Its appearance is most picturesque. Between Jebel Barkal and the river lay the ancient Ethiopian capital, Napata, destroyed by the Romans under C. Petronius, in 24 B.C. The site of the city is marked by the ruins of several large temples, among which that of the god Amon is the most conspicuous, and by groups of royal tombs, built in imitation of the Egyptian pyramids, though upon a much smaller scale. Excavations conducted at this place by the Egyptian government in 1862 yielded rich results in sculptures and hieroglyphic inscriptions of historic interest. The best representations of the monuments of Jebel Barkal are to be found in the fifth volume of Lepsius' *Denkmaler* (Berlin, 1842-45) and in Mariette's *Monuments divers* (Paris, 1872-89). For descriptions of the locality, consult Cailliard, *Voyage à Meroc* (Paris, 1819) and Hoskins, *Travels in Ethiopia* (London, 1835).

BARK BEETLE, BARK CHAFER, or ENGRAVER BEETLE. A minute cylindrical beetle, of the family Scolytidae. These beetles live in or under bark and in wood. Most of the very numerous species burrow between the bark and the wood, and a few forms tunnel through the wood. (See **AMBROSIA BEETLE**.) The female starts each series of engravings and deposits her eggs there. The young, on hatching, dig a series of burrows at angles with the original burrow of the parent. These beetles and their young are very destructive to trees, either killing them outright or injuring the value of the wood by means of their burrows. Several destructive species live in the United States, and one is extremely injurious to the pine forests of Germany.

There are some 150 species of the minute beetles belonging to this genus in the United States. A recent estimate of \$100,000,000 annual damage to the forests of our country credits most of the harm to the Scolytidae.

BARK'ENTINE. See **BARK**.

BARK'ER, ALBERT SMITH (1843-). An American naval officer, born at Hanson, Mass. He graduated at the United States Naval Academy in 1862, and during the Civil War took part in the capture of New Orleans and the siege of Port Hudson. He was promoted to be commander in 1877 and in 1892 to be captain. During the Spanish-American War he commanded the cruiser *Newark*; and afterward succeeded Admiral Dewey as commanding officer of the Asiatic Squadron. He was made a rear-admiral in 1899, commanded the Norfolk Navy Yard in 1899, the New York Navy Yard in 1900-03, and the North Atlantic fleet in 1903-05, when he was retired.

BARKER, EDMUND HENRY (1788-1839). An English classical scholar, born at Hollym, Yorkshire. He studied at Cambridge. Besides editions of Latin classics and numerous contributions to periodicals, particularly to the *Classical Journal*, he was led, during a residence with the famous philologist Samuel Parr, to undertake a revision of Stephanus' *Thesaurus Linguae Graecae* (12 vols., 1826). This gigantic work was violently assailed in the *Quarterly Review* by Blomfield, to whom Barker replied with his *Aristarchus Anti-Blomfieldianus* (London, 1818). In 1812 appeared the first volume of his *Classical Recreations*. He also supplied materials for the composition of Sturtz's *Etymologicum Gudianum*. He likewise translated some works of German philologists, among them Buttman's *Greek Grammar for Schools*. He collected a mass of anecdote and criticism relative to his friend Dr. Parr, which was published in two volumes in 1828-29, under the title of *Parriana*, a work well-nigh unreadable from the superabundance and ill-digested nature of its matter. He also assisted Professor Dunbar in the compilation of his Greek and English Lexicon, published in 1831. He lost all that he had in a lawsuit, so that he was obliged to sell his fine library, and was put into the debtors' prison. He died in London in extreme poverty.

BARKER, FORDYCE (1818-91). An American physician. He was born at Walton, Me.; graduated at Bowdoin in 1837, and studied medicine at Harvard, Paris, and Edinburgh. He was then professor of midwifery at Bowdoin and afterward in the New York Medical College; was president of the New York State Medical Society, and professor of clinical midwifery and diseases of women in Bellevue Medical College. He wrote, in 1872, a treatise on *Puerperal Diseases* and a number of papers on other subjects.

BARKER, GEORGE FREDERICK (1835-1910). An American scientist. He graduated at the Yale Scientific School in 1858 and was chemical assistant in Harvard Medical School in 1858-59 and 1860-61. He was then, successively, professor of chemistry and geology in Wheaton (Ill.) College, professor of physiological chemistry and toxicology in Yale, and professor of physics in the University of Pennsylvania, in 1879-1900, when he became emeritus professor. He was president of the American Association for the Advancement of Science; president of the American Chemical Society; vice president of the American Philosophical Society for 10 years; a member of the United States Electrical Commission; and for several years an associate editor of *The American Journal of Science*. He lectured in many cities and wrote a *Text-Book of Elementary Chemistry* (1870); a *Physics* (1892), etc.

BARKER (HARLEY) GRANVILLE (1877-). An English playwright who began his career as an actor and continued it as joint manager of the Court Theatre, London, and later as an author. He appeared in a number of Bernard Shaw's plays, and Shaw's influence on his work is obvious. He is a younger exponent of the realistic and revolutionary drama which would carry ideas into the theatre and make the stage responsive to the movements of thought and feeling that sway the world without. A criticism of moral, social, and political aspects of contemporary life is woven through his plays

and voiced by characters who speak and act in the dispassionate, unromantic, rational, and "advanced" fashion of those who people the Shavian drama. His dramatic work is notable for technical skill and for a flexible and natural dialogue that produces the illusion of living speech, but tends in its abundance to smother or hamper the action. The plays of which Barker is sole author are: *The Marrying of Anne Leete* (1901); *The Voysey Inheritance* (London, 1905); *Waste* (London, 1907); *The Madras House* (London, 1910). He collaborated with Laurence Housman in *Prunella* (London, 1906), which was produced by Winthrop Ames in New York in 1913. With Berte Thomas he wrote *The Weather Hen*, and he paraphrased from the German Schmitzler's *Anatol* (produced New York, 1912). He collaborated with William Archer in writing a plea for *A National Theatre* (London, 1907).

BARKER, JACOB (1779-1871). An American financier and lawyer, born in Swan Island, Me., of Quaker parentage. He went to New York at the age of 16, engaged in trade, and soon amassed a considerable fortune. Early in the War of 1812 he was instrumental in securing a loan of \$5,000,000 for the national government. In 1815 he founded the Exchange Bank of New York and subsequently became interested in many other large financial institutions in the city, including the Life and Fire Insurance Company, on the failure of which in 1826 he, with a number of others, was arrested on a charge of conspiracy to defraud. Barker at first conducted his own defense, but subsequently was represented by such eminent counsel as Benjamin F. Butler and Thomas A. Emmet. The jury disagreed on the first trial and convicted Barker on the second; but an appeal was granted, and the indictment was finally quashed. He removed to New Orleans in 1834, became prominent in financial circles, was admitted to the bar, and practiced with success in insurance cases. At the close of the Civil War he was elected to the United States Senate, but, Louisiana not having been readmitted to the Union, he was not allowed to take his seat. In 1867 he was declared bankrupt and spent the last few years of his life with his son in Philadelphia. He published *The Rebellion: Its Consequences and the Congressional Committee, Denominated the Reconstruction Committee, with their Action* (1866).

Consult: *Incidents of the Life of Jacob Barker from the Year 1800 to the Year 1855* (New York, 1855); Turner, *The Conspiracy Trials of 1826 and 1827: A Chapter in the Life of Jacob Barker* (Philadelphia, 1864); *The Speeches of Jacob Barker and his Counsel on the Trials for Conspiracy* (New York, 1826); and *The Trial of Jacob Barker, Thomas Vermilya, and Matthew L. Davis* (New York, 1827).

BARKER, J. ELLIS (1870-). An English journalist and historian, born and educated at Cologne, Germany. He became known after removal to England as a contributor to the leading reviews of that country and as a lecturer before the Royal United Service Institution, the Medical Association, and other important societies. His writings include: *The Rise and Decline of the Netherlands* (1906); *British Socialism* (1908); *Great and Greater Britain: The Problems of Motherland and Empire* (new ed., 1910); *Modern Germany* (4th ed., revised, 1912).

BARKER, LEWELLYS FRANKLIN (1867-). A Canadian-American anatomist, born at Norwich, Ontario. He studied at Pickering College and the University of Toronto, and in 1894-1900 was a member of the teaching staff at the Johns Hopkins University. He was head of the department of anatomy in the Rush Medical College of the University of Chicago, in 1900-1905, when he became professor of medicine at Johns Hopkins University, and chief physician at the Johns Hopkins Hospital. He received an honorary M.D. from the University of Toronto (1905) and an LL.D. from Queen's (1908) and from McGill (1911). In 1901 he became editor of the *American Journal of Anatomy*. His publications include: *The Nervous System and its Constituent Neurons* (1899); *Laboratory Manual of Human Anatomy* (1904); *Anatomical Terminology* (1907).

BARKER, MATTHEW HENRY (1790-1846). An English writer of sea tales, born at Deptford. He shipped on an East Indiaman, afterward served in the Royal navy, and from 1827 to 1838 edited a newspaper at Nottingham. Under the pseudonym "The Old Sailor," he wrote a number of sea tales, exceedingly popular at that time. The list of his works includes: *Land and Sea Tales* (2 vols., 1836); *Topsail-Sheet Blocks* (3 vols., 1838); *The Naval Club* (3 vols., 1843); *The Victory* (3 vols., 1844), and a *Life of Nelson* (1836).

BARKER, THOMAS JONES (1815-82). An English historical and portrait painter, born at Bath. He studied in Paris under Horace Vernet, in 1835-45 exhibited much at the Salon and subsequently at the Royal Academy. In his later life he was known especially as a military painter, and observed on the spot the Franco-Prussian War, of which, as well as of the Crimean War, he left numerous pictures. His works include "The Bride of Death" (1840); "The Meeting of Wellington and Blücher" (1851); "Wellington Crossing the Pyrenees"; "The Mélé—Charge of Cuiraissiers and Chasseurs" (1872); "Balaklava—One of the Six Hundred" (1874); "The Return through the Valley of Death" (1876).

BARKER, WHARTON (1846-). An American financier and publicist, born in Philadelphia, Pa. He graduated from the University of Pennsylvania in 1866, but prior to this time had organized and commanded a company in the Civil War. As a member of the banking firm of Barker Bros. & Co., he was appointed (1878) special financial agent of the Russian government. In this capacity he was intrusted with the building of four cruisers and was called to Russia to advise in the development of coal and iron mines. He also obtained valuable railroad, telegraph, and telephone concessions (later withdrawn) from China. As early as 1869 he founded the *Penn Monthly*, a weekly devoted to political, economic, and social questions, which in 1880-1900 was published under the name of *The American*. In the field of politics Mr. Barker became known as the proposer for the presidency of the names of Garfield and Harrison, and as one of the chief opponents of a third term for General Grant. Having left the Republican party in 1896 to join the Populists, he showed himself so zealous that he was made their candidate for the presidency in 1900. He became a member of several learned societies.

BARK'ERS. See JUMPERS.

BARKER'S MILL (Fr. *roue-à-réaction*, Ger. *Segners Wasserrad*). A water wheel invented by a Dr. Barker towards the end of the seventeenth century. It is represented in its simplest or typical form in the cut. The water is supplied from a reservoir which opens into the upper part of the vertical tube, whence it issues from the lower orifices. The reaction caused by the water gushing from the arms forces them backward and gives to the whole machine a rotatory motion. This reaction is much the same as is seen in the recoil of a gun when fired, or in the pushing back of a small boat by the foot on stepping ashore.

BARKER'S MILL.

BARK'ING (AS. *Beorcingas*, descend-

ants of Beore). A town of Essex, England, a northeastern suburb of London, on the left bank of the Roding, 2 miles above its confluence with the Thames (Map: London, D 9). It has jute factories, manufactures coke, rubber, and chemicals, and vegetable gardening is extensively carried on for the metropolitan markets. The municipality owns electric and gas lighting plants, water works, and wharf; has provided artisans' dwellings, cottage allotments, recreation grounds, public baths, and free library, and maintains isolation hospitals and a cemetery. Its most notable edifice is the ancient and beautiful church of St. Margaret, and there are scanty remains of Barking Abbey, formerly one of the richest nunneries in England. It was founded in 670, by St. Erkenwald, Bishop of London, whose sister, St. Ethelburga, was the first abbess. It was burned by the Danes in 870, rebuilt by King Edgar in the tenth century, and dismantled by Henry VIII. Pop., 1891, 14,300; 1901, 21,500; 1911, 31,294. Consult *Barking Town: its Progress and Public Works* (London, 1897).

BARKING BIRD. See GUIDGUID.

BAR'KIS. A country carrier in Dickens's novel, *David Copperfield*. He marries David's nurse, Peggotty, to whom he proposes by sending her the message, "Barkis is willin'."

BARK LICE. See COCCIDÆ; SCALE INSECTS.

BAR'-KOK'BA, SIMON. The leader of the Jews in their great insurrection against the Romans, under the Emperor Hadrian, from 132 to 135 A.D. Hadrian's attempt to Romanize Judæa through the transformation of Jerusalem into a pagan city, and the gradual obliteration of Jewish customs, had awakened the fanatic zeal of the Jews all over the empire. Between 115 and 118 A.D., they rose in revolt in Cyrene, Egypt, Cyprus, and Mesopotamia, while in Palestine the only influence of the aged Joshua ben Hananiah retarded the outbreak. Under the inspiration of Akiba (q.v.), the successor of Joshua, secret preparations were begun for a rising of the entire nation. At the head of the movement stood Simon Bar-Koziba (i.e., of the

town of Koziba) to whom Akiba gave the name of Bar-Kokba, or, 'son of the star,' seeing in him the fulfillment of the prophecy, "Thereshall come a star out of Jacob" (Num. xxiv. 17). From all over the Orient Jews thronged to join his armies, which at the height of his power numbered no less than 400,000 men. He fought at first with great success against the Romans. Finnius Rufus could not resist the attack. The war spread over all the country of Palestine, and 50 towns, besides many villages and hamlets, came into the possession of the Jews. It is not probable, however, that Jerusalem fell into their hands. So important a fact would have been mentioned in the Jewish sources, but they do not refer to a capture of the holy city. But the success of the Jews was such that Publius Marcellus the legate of Syria was sent against them. He also was defeated. Hadrian then summoned his greatest general, Julius Severus, from Britain. The Romans are said to have fought 52 battles with the forces commanded by Bar-Kokba. Finally, in August, 135, Bethar, the last strong fortress held by them, was stormed by the Romans after a siege of nearly a year. According to Dio Cassius half a million of Jews perished in the assault and the massacre that followed, and among them fell Bar-Kokba. After the war many men were executed, thousands of women and children were sold into slavery, and cruel edicts were issued against the survivors. From this last struggle dates the final dispersion of the Jews over the face of the earth. The holy city was razed to the ground and rebuilt under the name of *Ælia Capitolina*. There can be no doubt as to the military genius and splendid patriotism of Bar-Kokba. But the disenchantment was so great, the punishment of the rebellion so severe, that the 'son of the star' was declared by many Jews to be 'the son of a he,' with an allusion to the meaning of Koziba, which probably was the name of his birthplace. For a detailed account of the struggle, consult Münster, *Der jüdische Krieg unter den Kaisern Trajan und Hadrian* (Altona, 1821), and Schwarz, *Der Bar-Kochbaische Aufstand* (Brünn, 1885).

BARKSDALE, WILLIAM (1821-63). A Confederate officer in the Civil War in the United States. He was born in Tennessee, was educated at Nashville University, studied law, and served in the Mexican War. In 1853-61 he represented Mississippi in Congress as a pro-slavery Democrat, and upon the outbreak of the Civil War resigned his seat to take command of the Thirtieth Mississippi Volunteers. He was promoted to be brigadier general, and fell at Gettysburg.

BARK STOVE. See HOTHOUSE.

BARLAAM, bār'lā-ām (?-c.1348). A learned Italian monk. He was born at Seminaria, Calabria, and entered the Order of St. Basil. He afterward studied at Thessalonica, joined the Greek church at Constantinople, and wrote his polemical *Liber contra Primum Papæ*. He was sent by Andronicus III in 1339 on a diplomatic mission to Pope Benedict XII, to obtain the assistance of Western Christendom against the Turks. Failing in this, he returned to Greece and attacked the Hesychasts, or Quietists, of Mount Athos. At a synod held in 1341 the Hesychasts were so skillfully defended that he hastened to Italy, reentered the Roman church, and was appointed Bishop of Gerace. His principal work is *Ethica secundum Stoicos*. Barlaam was a man of great learning, distin-

guished as philosopher, mathematician, and astronomer. Among his pupils was Petrarch. Consult G. Manlari, *Fra Barlaamo Calabrese, maestro del Petrarca* (Rome, 1888).

BARLAAM AND JOSAPHAT. One of the most widely spread religious romances of the Middle Ages. It is a Christianized version of the legendary history of Buddha, agreeing with it in many details. The story is briefly as follows: Josaphat was the only son of a heathen king in India, named Avenier or Abenner. In order to prevent the fulfillment of a prediction that he would be converted to Christianity, Josaphat was brought up in close confinement under the care of heathen teachers and surrounded by every luxury. Being visited, however, by a Christian hermit, Barlaam, he learned of the strange faith and was baptized. So great was his piety that he converted many of his companions and finally even his father. On the latter's death he succeeded to the kingdom, but soon after abdicated in favor of his friend Barachias and went into the wilderness. There, after two years of painful search, he found again Barlaam and lived a holy life. The celebrated divine, John Damascene, was formerly regarded as the author of the original Greek MS., which was first published by M. de Boissonade in the fourth volume of his *Anecdota* (Paris, 1832) and translated into German by Liebrecht (Münster, 1847). But even in the Middle Ages a Latin version of this romance had been extensively circulated. About the end of the fifteenth century it was often printed in a detached form, and later it appeared among the works of John Damascene (Paris, 1609). This theory of its authorship is no longer accepted. Vincent de Beauvais wove the story into his *Speculum Historiale*. In a condensed form the story appears in the *Golden Legend* of Jacobus de Veragine. From the Latin version sprang three French poetical versions belonging to the thirteenth century and as yet unprinted. The Italian *Storia di S. Barlaam* (latest ed., Rome, 1816) may be traced to a Provençal original as early as the beginning of the fourteenth century. In Germany Rudolf von Ems derived his poem, *Barlaam und Josaphat*, first printed at Königsberg (1818), and later at Leipzig, from the Latin. There is also an Augsburg impression of a prose translation of the ancient Latin text belonging to the close of the fifteenth century. *Baarlaam and Josaphat* appears in Middle English, in both a prose and a poetical version, the former edited by C. Horstmann. The Spanish *Historia de Barlaam y Josaphat*, by Juan de Azre Solorzano (Madrid, 1608), the Polish poetical version, by Kulizowsky (Cracow, 1688), and also the Bohemian (Prague, 1593), are all borrowed from the Latin; while the Icelandic *Barlaams Saga*, and the Swedish popular tale, *Barlaam och Josaphat*, both from the fifteenth century, have a German source. A Norwegian version, printed from an old vellum MS. of the beginning of the thirteenth century, said to have been translated by King Hakon Sverreson, appeared in 1851 (Keyser und Unger, *Barlaams ok Josaphats saga*, Christiania, 1851). This romance has even been rendered into the Tagalog language of the Philippines and there printed (Manila, 1712). Consult: Liebrecht, *Zur Volkskunde* (Heilbronn, 1879); Max Müller, *Selected Essays* (London, 1881); H. Zotenberg, *Notice sur le livre de Barlaam et Josaphat* (Paris, 1886); Joseph Jacobs, *Barlaam and Josaphat* (London, 1896); Appel, *Gui von Cam-*

brai und Josaphas nach den handschriften von Paris und Monte Cassino (Halle, 1907).

BARLÆUS, bär-lē'ūs, KASPAR, properly VAN BAERLE or BAARLE (1584-1648). A Dutch poet and historian, born at Antwerp. He studied theology at Leyden, was appointed professor of logic there in 1617, and in 1619 was deposed as a partisan of the Remonstrants. In 1631 he was called to the chair of philosophy and eloquence in the Athenæum of Amsterdam. He published *Poemata* (1645-46) and *Rerum per Octennium in Brasilia et Alibi Nuper Gestarum Historia* (1647).

BAR-LE-DUC, bär'le-duk', or **BAR-SUR-ORNAIN**, -sur' ōr'nān' (Fr. the duke's citadel, from Gael. *barr*, summit, projection, fort). The capital of the department of Meuse, France, on the Ornain and the Canal de la Marne, 158 miles by rail east of Paris (Map: France, N., L 4). It is divided into three parts by the river and canal and has fine boulevards. Its chief buildings are the fine fourteenth-century church of St. Etienne or St. Pierre, the Hôtel de Ville, at one time Oudinot's mansion, the Café des Oiseaux, containing a collection of stuffed animals and birds, a commercial museum, library, and a theatre. The manufacturing establishments include cotton and woolen mills, tanneries, breweries, paper mills, foundries, and confectioneries. It produces excellent wine, and a variety of currant jam made there is an important article of commerce. Bar-le-Duc dates from the sixth century and was formerly the residence of the Dukes of Bar. Pop., 1896, 18,249; 1901, 17,693; 1906, 17,307; 1911, 17,068.

BARLETTA, bär-lēt'ta (anciently, *Bardoli*, later *Barolum*). An island port in the province of Bari, south Italy, connected with the mainland by means of a bridge across the Adriatic (Map: Italy, L 6). It is on the Bologna-Brindisi Railway, 35 miles northwest of Bari, with which it is also connected by a street railway. It is surrounded by ancient turreted walls and has spacious squares and broad streets. The houses are high, with flat terraced roofs, and built mostly of sandstone. There are many beautiful Byzantine churches, among them the cathedral of Santa Maria Maggoire, in which Ferdinand of Aragon was crowned. Interesting palaces are that of unhappy King Manfred, now turned into a convent, and the great castle constructed under Charles V. On the large square, facing the harbor, and in front of the Gothic church of San Sepolero, stands the celebrated bronze statue, 15 feet high, found in the sea and evidently of Roman workmanship, said to be a likeness of Heraclius, Constantine, or Theodosius. In another square is a monument to the statesman Massimo d'Azeglio, who died in 1866. The inner harbor is accessible to small vessels only; but there is good anchorage for larger vessels in the roadstead, which is protected by a mole, running out into the sea, on which stands a lighthouse. Barletta has regular steamboat communication with other Adriatic ports and exports wine, oil, leather, cheese, fruit, hemp, and tartar. Imports include cotton, sulphur, and fish. In 1503, during the war between Louis XII and Ferdinand the Catholic, when Barletta was besieged by the French, there took place outside the wall, according to the rules of chivalry, the famous combat between 13 Bayard knights and 13 Italian knights, led by Bayard, *chevalier sans peur et sans reproche*, and Prospero Colonna respectively. Nine miles

west of Barletta, on the Ofanto, is Canne, the ancient Cannæ, where in 216 B.C. Hannibal inflicted a disastrous defeat on the Romans. Pop., 1881, 33,179; 1901 (commune), 42,022; 1911, 44,233.

BARLEY (AS. *bærlic*, from *bere*, Eng. *bear*, barley + *lēc*, a leek, plant). *Hordeum vulgare*. One of the most ancient of cultivated plants, of the Gramineæ, or grasses. Its cultivation is mentioned in the Bible. It was grown by the ancient Egyptians, the Greeks, and the Romans, and by the Chinese long before the Christian Era. Barley is found growing wild in western temperate Asia, and this region is considered as its original home. The range of latitude in which barley is cultivated is quite large, being grown as far north as Alaska, Iceland, and Norway, as well as in Algeria, Egypt, India, and other countries with an almost equatorial climate. In Switzerland and Chile it ripens at an altitude of 5000 feet, but it rarely ripens on the plateaus of Peru, which have an elevation of 9000 feet.

The preparation of the soil for barley does not differ materially from that for wheat. The land should be plowed fairly deep and thoroughly pulverized to form a well-prepared seed bed. The soil should be porous, well drained, and of good fertility. Barley grows best on sandy and calcareous loams in northern latitudes, but in southern countries soils containing a little more clay give the best results. The plant has a comparatively short growing period, ranging from 75 to 90 days, and the tilth and fertility of the soil should be such as to enable it to make a rapid growth. An excess of nitrogenous manures in the soil is injurious. When barnyard manure is applied directly to the crop, it should be well rotted. The best method, however, is to apply it to a previous crop, preferably corn. Barley is very responsive to a good rotation, generally giving better yields when it follows a hoed crop like corn and when clover is included in the succession of crops. For illustration, see Colored Plate of CEREALS.

In the United States and Canada, as well as in the greater portion of Europe, barley is sown in spring, and in the countries along the Mediterranean Sea it is sown in the fall. It is, however, also grown to some extent as a winter annual in the Southern States. The quantity of seed sown per acre varies from 2 to 3 bushels. Barley germinates at about the same temperature as wheat, but the young plant is more susceptible to cold than wheat; and a light frost, shortly after it is up, is often injurious. In the regions of the United States where spring wheat is grown, it is a common custom to sow it after wheat and before oats are sown. It is generally sown broadcast, but many farmers, especially in England, prefer to sow it in drills from 8 to 10 inches apart. The crop is now generally harvested with the self-binder. As soon as the sheaves are dry enough, they are stacked or hauled into barns to prevent exposure to rains or damp weather, which discolours the grain and materially reduces its value. Barley ripens earlier than spring wheat and is harvested usually just before that crop. When grown for malting purposes, it should not be harvested before it is thoroughly ripe.

The different varieties of barley, considered by many botanists as all belonging to one species, comprise four distinct types, viz., two-rowed barley, *Hordeum sativum distichon*; four-rowed

barley, *Hordeum sativum vulgare*; six-rowed barley, *Hordeum sativum hexastichon*; and naked barley, *Hordeum nudum*. Some authorities consider these different types as distinct species. The varieties of barley grown in the United States are generally of the six-rowed type, while in Europe the two-rowed type predominates. The finest varieties of malting barley, including Chevalier barley and the various selections made from it, which are the most popular for malting purposes, belong to the two-rowed type. The four-rowed varieties, frequently called "here" or "bigg" in England, were formerly extensively used for malt, but are now being more and more replaced by the two-rowed varieties. The characters which determine a good malting barley are composition, capacity and energy of germination, plumpness and weight of grains, mealiness, proportion of husk (glumes adhering to grain), color, smell, and absence of mutilated kernels. In malting, barleys of a high starch content and a low protein content are sought. Quick and even germination produces the best malt, hence the brewer's interest in the state of ripeness and the absence of injured grains—conditions which directly affect germination. Plumpness and weight of the grains and the proportion of husk give indications as to a high or a low percentage of starch. Mealiness is important, as it insures a much more ready transformation of the starch into soluble compounds than when the grains are hard and flinty. A musty smell and a stained or discolored appearance of the grain are evidences of injury and materially reduce the value of barley from the brewer's point of view. The best malting barleys of the world are produced in eastern and southeastern England. The well-known Chevalier variety was originated in Suffolk in 1819.

From 35 to 40 bushels of barley per acre is considered a good yield, although under very favorable weather and soil conditions the yield often reaches 60 bushels per acre or even more. The legal weight per bushel in the United States is generally 48 pounds. The world's annual production of barley is about 1,400,000,000 bushels, the leading countries in order of yield being European Russia, the United States, Germany and Austria-Hungary. In the United States the production has largely increased during the last 60 years. The total yield of barley in 1912 was 223,824,000 bushels as compared with 5,167,015 bushels in 1849. In 1912 the following States ranked first in total yield: Minnesota, 42,018,000 bushels; California 41,760,000 bushels; North Dakota, 35,162,000 bushels; Wisconsin, 24,843,000; and South Dakota, 23,062,000 bushels. The average annual yield throughout the United States is about 25 bushels per acre. The average price per bushel on December 1 of each year for the years 1900 to 1909 was 47.9 cents.

Barley is affected in much the same manner as wheat by attacks of smut and rust. It is, however, much less liable to disease than any other cereal crop. The loose smut of barley *Ustilago nuda*, is the most serious disease of this crop in the United States. It may be controlled by soaking the seed for six or seven hours in cold water followed by 15 to 30 minutes in water heated to 52° C. (124.6° F.). The seed should then be sown on clean land. See RUST; SMUT; WHEAT.

Food and Feeding Value.—Barley grain, hay, and straw, and several milling and by-products

from the grain, are used as feeding stuffs. The grain, like other cereals, contains a fairly large proportion of protein (12.4 per cent) and a large proportion of nitrogen-free extract (69.8 per cent), chiefly starch. The other constituents are: water (10.9 per cent), fat (1.8 per cent), crude fibre (2.7 per cent), and mineral matter (2.4 per cent). Barley is a common feeding stuff in the Old World, being satisfactorily used for the grain ration of horses, cattle, and pigs. Its use is not general in the United States, being confined largely to the Pacific slope, where it is fed especially to horses. Tests at different American experiment stations have shown that, either alone or mixed with corn or other grain, it gives fairly satisfactory results with cattle, pigs, and sheep. In experiment with pigs, 80.1 per cent of the dry matter, 81.4 per cent of the protein, and 86.6 per cent of the nitrogen-free extract of barley was found to be digestible. Barley is grown quite extensively for hay in some sections of the United States, being cut for that purpose before the grain is mature. The principal by-products are barley bran, barley feed (from pearled barley), screenings, malt sprouts, and brewer's grains (q.v.). The mill products are meal and pearled barley. As a food barley is used chiefly in the form of "pearled barley," i.e., barley with the husks removed, ground to a round form and polished.

Barley is used for thickening soups, for making cooling drinks for invalids, and for a number of other purposes. The ground grain does not make a satisfactory bread; for, although it contains a fairly large amount of proteid matter, it is deficient in gluten. Barley water is sometimes used in the treatment of infants for intestinal disorders, and special barley preparations are combined with cow's milk in preparing food for infants and invalids.

BARLEYBREAK. A popular amusement, very common in the reign of James I and, with certain modifications in name and practice, still existing among young persons in both England and Scotland. Originally it was played by six people, three of each sex, who were formed into couples. A piece of ground was then apportioned into three parts, and into the central one, called *hell*, a couple was doomed by lot. The sport consisted in the condemned couple's "catching" one of the other couples while they were in the act of changing places, when the couple thus caught had to go into the centre. It was no easy matter, however, for the two in the centre to capture another couple; for, by the rules of the game, they were bound to keep united, while the others, when hard pressed, might sever. This quaint game is poetically described in Sidney's *Arcadia* and Suckling's *Poems*.

BARLEYCORN, JOIN. A personification of the spirit of barley or malt liquor, used jocularly and in humorous poetical effusions as by Robert Burns. There exists a whimsical English tract of old date, under the title of *The Arraigning and Indicting of Sir John Barleycorn, Knt., printed for Timothy Tossopot*, in which Sir John is described as of "noble blood, well beloved in England, a great support of the Crown, and a maintainer of both rich and poor."

BARLEY RUST. See RUST.

BARLOW, FRANCIS CHANNING (1834-96). An American soldier and lawyer, born in Brooklyn, N. Y. He graduated at Harvard in 1855 and was admitted to the New York bar. In 1861 he enlisted in the Twelfth New York Na-

tional Guard, and after a three months' term became lieutenant colonel of the Sixty-first New York Volunteers. He participated in the battles of Antietam, Chancellorsville, and Gettysburg and was mustered out with the rank of brigadier general and brevet major general. From 1866 to 1868 he was Secretary of State for New York and in 1872-73 was Attorney-General of the State. In the latter capacity he directed the prosecution of William M. Tweed (q.v.) and other members of the notorious "Tweed Ring" in New York City. He subsequently practiced law and was one of the founders of the Association of the Bar of New York City.

BARLOW, JANE (1860-). An Irish novelist, daughter of Rev. J. W. Barlow, viceprovost of Trinity College, Dublin. She was born at Clontarf, near Dublin, Oct. 17, 1860. She has described, with rare sympathy and humor, Irish village life, employing sometimes verse, but usually prose. *Bog-land Studies*, verse (1892), has been followed by *Irish Idylls* (1892); *Kerrigan's Quality* (1893); *The End of Elfin-toun* (1894); *The Battle of the Frogs and Mice* (1894); *Maurcen's Faring* (1895); *Strangers at Lisconnel* (1895); *Mrs. Martin's Company* (1896); *Creech of Irish Stories* (1897); *From the East unto the West* (1898); *From the Land of the Shamrock* (1900); *Ghostbereft and other Stories* (1902); *From Beach and Bog Land* (1905); *Irish Ways* (1909, 1911); *Flaws: a Novel* (1911). She was made an honorary Doctor of Letters by Dublin University.

BARLOW, JOEL (1754-1812). An American poet and man of affairs. He was born at Redding, Conn., March 24, 1754, and was educated first at Dartmouth, then at Yale, developing early great poetical aspirations. In 1780, two years after graduating, he entered the army as chaplain, and after the peace studied law at Hartford, where, in 1786, he was admitted to practice. In the previous year he had edited a *Book of Psalmody* for the Congregational churches of Connecticut, which was used until his religious opinions became heterodox. He also took part in political and literary journalism and wrote verses with the other "Hartford Wits." In 1787 his rather pompous poem, *The Vision of Columbus*, greatly admired at the time, made him very well known. It brought him also the European agency of the Scioto Land Company, which had acquired redemption rights in 3,500,000 acres of land in Ohio and sought to market them abroad. On this fraudulent mission Barlow innocently went in 1788 to France, beginning a long exile in which his religious and political opinions were much liberalized. He also passed some time in London, associating with the advanced liberals; and here, as well as in France, he published political works, the most noteworthy of which is *Advice to the Privileged Orders*, proscribed by the British government. Late in 1792 Barlow returned to France and was active in politics till his defeat as candidate for the Convention in 1793. At this period he obtained the hint for *Hasty Pudding*, his most popular poem, a mock heroic that is still readable. He now embarked in commerce and made a considerable fortune. In 1795, with great self-sacrifice, he became consul at Algiers and rendered valuable services to American prisoners. Returning to Paris, he led a literary life, preparing historical works on the American and French revolutions, which were never completed, and expanding his *Vision of Columbus* into an

epic, *The Columbiad*, which, when published in 1807, in a magnificent quarto, was at first regarded as remarkably fine, but soon fell absolutely flat, because of its pomposity and its absurd attempt to foist upon almost contemporary events the traditional allusions of classical mythology. In 1805, having never lost his patriotism, which he had shown during the X Y Z Affair, he returned to America, where he was cordially received by the Republicans, but vituperated by the Federalists. Until 1811 he resided at Kalorama, near Washington, cultivating literature and farming. He was then appointed commissioner to Napoleon and accepted the office only from a sense of duty. Going to meet Napoleon at Vilna, he became involved in the disastrous retreat of the French army from Russia, and died of exposure at a small Polish village, Dec. 24, 1812. Barlow's merits as a poet were small, but he was a fair prose writer, a cultivated and enterprising man of affairs, and a true patriot. Consult Todd, *Life and Letters of Joel Barlow* (New York, 1886), and Trent, *American Literature* (New York, 1903).

BARLOW, JOHN WHITNEY (1838-). An American soldier, born at Perry, N. Y. After graduating from the United States Military Academy in 1861, he served throughout the Civil War. He was breveted captain in 1862, major in 1864, and lieutenant colonel in 1865 for his services respectively in the battle of Hanover Courthouse, the Atlanta campaign, and the battles before Nashville, Tenn. After the war he directed various military engineering works and harbor improvements and conducted explorations of the headwaters of the Yellowstone and Mississippi rivers. From 1892 to 1896 he was in command of the United States engineers in marking the boundary between the United States and Mexico. Subsequently he served as division engineer of the southwest division, then of the northwest division, and finally he was a member of the United States Board of Fortifications.

BARLOW, WILLIAM HENRY (1812-1902). An English engineer. He was born and educated at Woolwich. In 1832 he went to Constantinople, where he planned the factory and machinery for the improvement of the Sultan's ordnance, and examined the lighthouses at the entrance to the Bosphorus. For this service he received from the Sultan the decoration of the "Nischan." He was the engineer of the new bridge over the Tay (1880-87), and cooperated with Sir J. Fowler and J. Harrison in designing the Firth of Forth Bridge. He was president of the Institution of Civil Engineers in 1880. Among his publications may be mentioned: *Illumination of Lighthouses* (1837); *Diurnal Electric Tides and Storms* (1848); *Resistance of Fleure in Beams* (*Proceedings of the Royal Society*, 1855); *The Logograph* (1874).

BARLOWE, ARTHUR (c.1550-c.1620). An English navigator. In 1584 he and Philip Amadas (q.v.) were sent out by Sir Walter Raleigh to find a favorite location for a colony in America. Leaving England April 27, they reached the Canaries May 10, and one of the West Indian Islands June 10, and "on the 2d of July," says Barlowe, "we found shole water, wher we smelt so sweet and so strong a smel as if we had been in the midst of some delicate garden abounding with all kinds of odoriferous flowers." Two days later they sighted a part of the North Carolina coast. They returned to England, bring-

ing glowing accounts of the beauty and attractiveness of the new country. Barlowe wrote a detailed narrative of the voyage in a letter to Raleigh, which may be found in vol. iii of Hakluyt, *Principal Voyages, Traffiques, and Discoveries of the English Nation* (London, 1599-1600), and has been reprinted, in part, in vol. i of A. B. Hart, *American History Told by Contemporaries* (4 vols., New York, 1897-1901).

BARMECIDES, or **BARMEKIDES**. A Persian family, celebrated in history as the ministers of the early Abbasside caliphs. Khaled-bin-Barmek was the Chancellor of the Exchequer under Abu'l Abbas as-Saffah, the first Abbasside caliph; and his influence endured through the reigns of Al-Mansur and Al-Mahdi. Yahya, the son of Khaled, was intrusted by Al-Mahdi with the education of his son, the celebrated Harun al-Rashid, and was made vizier by Harun upon his accession to the caliphate (A.D. 786). By his military skill and wise civil administration he contributed largely to the prosperity of the reign, the caliph himself bestowing on him the appellation of "Father." Yahya's sons, Fazl and Ja'far (the Giafar of the *Arabian Nights*), were greatly beloved by the caliph, who appointed Ja'far vizier to succeed his father. But the splendor of the family and the unlimited power it enjoyed gained it many enemies, who persuaded Harun that the Barmecides were aiming at the crown. The caliph caused Ja'far to be executed, and the others to be thrown into prison. He carried his enmity so far as to forbid the mention of their name on pain of death; but their virtues and their glory are celebrated by the Mohammedan poets and historians, whose munificent patrons they were. Consult Muir, *The Caliphate* (London, 1891), and Weil, *Geschichte der islamitischen Völker* (Stuttgart, 1866).

BARMECIDE'S FEAST. A phrase which originated in a story related in the *Arabian Nights* (Story of the Barber's Sixth Brother). A poor man who had not had food for two days visited one of the rich Barmecides, the influential Persian family in the time of Harun al-Rashid, and asked for food. He was invited to dinner. One after another, empty dishes were brought in, and the host asked the man how he liked the food. All was taken good-naturedly until the wine was brought, when the guest, pretending to be drunk, boxed the host on the ear. This bit of humor thoroughly delighted the Barmecide, and he ordered that a real feast be placed before the man.

BAR'MEN. A city in the province of Rhenish Prussia, on the Wupper, about 25 miles northeast of Cologne (Map: German Empire, B 3). It is divided into upper, middle, and lower Barmen, includes several small villages, now united into one district, and its western boundary adjoins the city of Elberfeld. The city has clean and well-kept streets, the principal avenue being the Alleestrasse. The river, which flows through the length of the city, is crossed by many bridges. Among the noteworthy buildings are the old and the new Rathaus and the municipal theatre. There is only one park, which was formed from woodland purchased by the city. Barmen owns its water works, its gas works, and electric light plants, all of which net large profits to the city. It has numerous benevolent and charitable institutions, including a municipal hospital. Educational institutions consist of a gymnasium, several high schools, an industrial school, a nat-

ural-history museum, a library, and a picture gallery. The district adjoining the city is one of the most populous and prosperous in Germany. Barmen is the principal seat of the ribbon manufacture on the Continent, producing linen, woolen, cotton, silk and half-silk ribbons, and, in addition, cloth of various kinds, staylages, thread, etc., all of which are widely exported. It has also considerable manufactures of soap, beer, pottery, candles, metal ware, buttons, machinery, organs, and pianofortes. There are, besides, in the valley, numerous bleachfields and Turkey-red dye works. Barmen has six railway stations and is in railway communication with all the principal German cities. Local traffic is served by several electric railways, including a novel aerial line built over and following the bed of the Wupper between Barmen and Sonnborn. Lower Barmen has a mineral spring and a bathing establishment. Pop., 1890, 116,000; 1900, 141,944; 1910, 169,214. Barmen was first mentioned in the eleventh century. By the fifteenth century the bleaching industry had become highly developed there, and its modern prosperity dates from its annexation to Prussia in 1815.

BAR'MOTE COURT (for earlier *bargemote*, *berghmote*, from *berg*, hill + *mote*, meeting). The name of local courts held in the lead-mining districts of Derbyshire, England, for the determination of the ancient rights and privileges of the inhabitants of those districts, in the lead mines, and for the settlement of disputes relating thereto. These courts are of great antiquity, but their jurisdiction and procedure are to a considerable extent regulated by statutes (14 and 15 Vict. c. 94). Consult *Encyclopædia of the Laws of England*, vol. ii, p. 18, and Bainbridge, *The Law of Mines and Minerals* (5th ed.; London, 1900).

BAR'MOUTH. A picturesque watering place in Merionethshire, Wales, situated at the mouth of the Maw, 230 miles from London (Map: Wales, B 4). On the opposite shore lies Cader Idris, over 2900 feet high. It is a popular bathing and coaching resort. Pop., 1901, 2214; 1911, 2106.

BARN (AS. *berern*, *born*, from *bere*, barley + *ern*, a closed place). A building used for the storage of feed, implements, machinery, and farm products, but more especially for the housing of stock, either under one roof or in separate, special buildings, depending on the size and type of farm. It is generally recognized that it is more convenient and economical of labor to make ample provision for all these purposes, except the housing of pigs, in one compact building on the farm of from 60 to 80 acres on which diversified farming is practiced. For larger farms or farms specializing in one or more lines it is often well to provide separate specially constructed buildings for the specialties.

Convenience and economy of labor make it desirable to have the barn centrally located, whether for general or special use, in as direct communication as possible with those fields or pastures to which its use is most closely related and at a convenient distance from the farmhouse though not so near as to be offensive or dangerous in case of fire. The location selected should be well drained either naturally or artificially, but away from the farmhouse or any source of water supply in use. A hillside facing the south furnishes an especially desirable site, since in addition to good drainage this makes possible a clean dry basement and warm dry stalls and

Design and Construction of Typical American Horse and Cattle Barn, North Dakota Experiment Station.

Floor plan of modern dairy barn for twenty-four cows

yards, opening on the grounds to the south, and a driveway to the upper floors for the general barn.

The main portion of the general barn, which may have two or more stories, is utilized mostly for the storage of feed, some farm products, and some of the implements that are in general and constant use on the farm. It should be constructed with a view to convenience and economy of space as well as strength, durability, and economy of material, the frame and balloon style of construction being especially adapted to this purpose. The farm animals are preferably housed in the basement. Adequate provision for proper lighting and ventilation is necessary for the health and comfort of animals. It is desirable that the basement face south, that windows be placed on both east and west sides, and windows and doors on the south side of the basement, so that the sun strike some inside portion of the basement at all hours of the day, and that the stalls be arranged conveniently for feeding and removing litter in parallel rows. Ventilation may be induced by means of flues opening near the floor or ceiling, but care should be taken that no animal is subjected to a direct draft.

An abundant supply of good water is also essential. Individual troughs are more hygienic than a common trough, but a common tank or trough in the open court constantly supplied with fresh water is a common and very satisfactory arrangement. If spring or artesian water under pressure is not available, a supply may be provided by pumping from wells or, in extreme cases, by storing rain water in cisterns. A constant supply under pressure is desirable and may be obtained by means of a storage tank placed in an upper story, by a pneumatic storage tank placed in the ground below frost line next to the building, or by the auto-pneumatic system in which water is supplied fresh from the well or cistern on opening a hydrant. Windmills, internal combustion engines, or electric motors are well adapted to supplying the power for pumping as well as for grinding feed and other belt work.

Special stock barns demand good drainage and good lighting; ventilation and warmth are important. Each stall should be specially designed and constructed for the accommodation of a particular type and size of animal. Concrete floors, runways, drains, and feedways in up-to-date stock barns are provided with litter and feed carriers traveling on steel tracks to facilitate the work of feeding and litter cleaning. A practically water-tight concrete manure pit located conveniently to the stock barns in which both the solid and liquid manure may be collected and stored with as little handling as possible, is a valuable addition, as it preserves the manure for fertilizing purposes and prevents pollution of the neighboring soil. There are many arrangements of stalls, but the best arrangement depends on the number and kind of animals housed and the location of the building. Stock barns usually have wide, slightly sloping roofs supported by steel trusses. These buildings are now constructed of lumber, brick, concrete, and cement block, or combinations of two or more of these. The brick and concrete materials have the advantages of strength, durability, fireproofness, and ease of erection, and constitute a building cool in summer and warm in winter. The initial cost, however, is somewhat higher than that of lumber.

Special hay barns are usually constructed of lumber and often are merely roofed with the siding extending only a short distance down, leaving the lower part of the sides open. Combination hay and stock barns have a high, wide, and long hay space in the centre with long low-roofed sheds surrounding this space in which the stock may gather and feed on the hay. Up-to-date hay barns are equipped with a steel track, hay fork, and carrier for elevating and depositing the hay.

The plan and construction of a barn will vary with the purposes for which it is used. It should be completely planned, even though it is intended at first to construct only a part of it. There is an almost infinite variety of internal fixtures for both stock and general barns, ranging from the very simple and cheap to the very elaborate and costly. Every barn used for the housing of stock, however, should be provided with one or more box stalls for the use of animals with young. A silo (q.v.) is a valuable adjunct, especially to a stock barn; it should form part of the structure, if possible, or should be so located that it will be easy to fill and convenient to feed from. Silos are now constructed of wood, concrete, concrete blocks, hollow tile, reinforced monolithic concrete, and galvanized steel metal, and some are constructed all or in part under ground.

BARNABAS (Gk. Βαρνάβας). The surname given by the Apostles to Joseph, one of the members of the early Jerusalem church and interpreted by the author of Acts to mean 'Son of Consolation' (Acts iv. 36), or 'of Exhortation.' He was a Levite and a Cyprian by race, though doubtless, in view of his aunt having her home in Jerusalem, he was at this time a resident of that city. He contributed to the community of goods among the disciples (Acts iv. 36, 37). He was sponsor for Saul (Acts ix. 27), an act which would seem not only to indicate the influential position which Barnabas held among the disciples, but to involve some previous acquaintance between Barnabas and Saul. This inference is borne out by his subsequent commission by the Church of Jerusalem to investigate the work at Antioch, from which place he went to Tarsus to secure the services of Saul. In this Antioch church he also quite naturally came to assume a prominent place, being represented at the head of the prophets and teachers who

were active there (Acts xiii. 1). Together with Saul, he was commissioned by the Antioch church to carry up to Jerusalem the relief prepared for the famine-stricken brethren of the city (Acts xi. 27-30), from which journey they returned only to be sent out by the home church upon missionary work for which they had been divinely selected (Acts xiii. 2).

Throughout this first missionary tour, embracing the southern region of Asia Minor, he was the efficient companion of Paul, returning with him to Antioch, where they became involved in the contention started by the Judaizing Christians (see JUDAIZERS) regarding the necessity of circumcision as a condition of salvation (Acts xv. 1), a contention to which the Jews had doubtless been aroused by the extraordinary success of the mission among the uncircumcised Gentiles. The question was brought by them before the Apostles and elders (Acts xv. 2). From this journey they returned to Antioch, where they again engaged in the work of the local church, until Paul suggested that they visit once more the churches which they had established on their missionary tour, when, owing to a dispute between them as to the efficiency of Mark, a nephew of Barnabas, in the work, they separated from each other, Barnabas taking Mark with him and going to Cyprus, his native place (Acts xv. 36-39). There had been previous difficulty between Paul and Barnabas, immediately after their return to Antioch from the council at Jerusalem (Gal. ii. 11-21), where Barnabas is shown to be somewhat out of harmony with Paul's broader Gentile views and is really included with Peter in Paul's severe rebuke. From this time Barnabas disappears from apostolic history, for Paul's mention of him in 1 Cor. ix. 6 merely implies that Barnabas was still engaged in active missionary work, not that he was again in Paul's company; while his reference to him in Col. iv. 10 would seem to indicate his death, since otherwise it is difficult to account for Mark's return to work with Paul.

The traditions concerning his subsequent life—that he proclaimed the gospel in Rome, even during the lifetime of Jesus; that he was founder and first bishop of the church at Milan; and that he suffered martyrdom at Salamis, on his native island of Cyprus—are valueless.

Tertullian assigns to him the authorship of the New Testament Epistle to the Hebrews (see HEBREWS, EPISTLE TO THE), referring to the current tradition of the Church as so accepting it, and quite evidently implying that he had MS. authority for his view. There is also a pseudepigraphical epistle which has come down to us under his name, and an apocryphal Acts, of late date, and an apocryphal Gospel, obscurely referred to, bear his name. See BARNABAS, ACTS, EPISTLE, AND GOSPEL OF.

BARNABAS, ACTS, EPISTLE, AND GOSPEL OF.

1. The apocryphal *Acts of Barnabas*, a work of late date, recounts his missionary tours and his death by martyrdom in his native Cyprus.

2. The extant *Epistle of Barnabas*, found in the Sinaitic MS., at the close of the New Testament writings, a didactic work, full of allegorical interpretations of the Old Testament and strongly anti-Jewish in its tone. Although Barnabas was held to be its author by early Christian writers from Clement of Alexandria on, the Epistle itself makes no such claim. In fact, while its contents disclose an Alexandrian rather than a Palestinian style of thought and

to this extent support the traditional authorship, yet the clear evidence given by the Epistle that its author was a Jew by persuasion rather than by birth, together with its extravagant denial of all historical connection between Judaism and the Gospel, renders any ascription of origin to the missionary companion of Paul out of the question. The place of its origin, as well as of its earliest reception, is Alexandria, and the readers to whom it was addressed are to be found in Lower Egypt. It has been variously dated—from as early as 70-79 to about 130 A.D. In view of the obvious interpretation which is to be given to the apocalyptic passage in chap. iv, the earlier of the above dates is to be preferred.

3. The existence of an apocryphal *Gospel of Barnabas* is hinted at in several obscure references in ancient documents, as, e.g., in the *Decretum* of Pope Gelasius, 496 A.D. What it contained is unknown, the extended Gospel, found under this name in a single Italian MS. (edited, with an English translation, in 1907), being a Mohammedan product with Gnostic elements.

Bibliography. For text and English translation of the *Epistle*, consult: Lightfoot, *Apostolic Fathers*, ed. Harmer (London, 1893); G. Künger, *History of Early Christian Literature* (Eng. trans., New York, 1897); A. Harnack, *Chronologie der altchristlichen Literatur*, vol. i (Leipzig, 1897). Consult also "Barnabas," in Hastings, *Dictionary of the Bible*, vol. i (New York, 1898), and id. in Cheyne, *Encyclopaedia Biblica*, vol. i (New York, 1899).

BARNABITES. An order of monks which sprang up at Milan about 1530. They were so called because the church of St. Barnabas in that city was granted them to preach in. They were approved of by Pope Clement VII (1533) and Pope Paul III (1535). Their official title is "Regular Clerks of the Congregation of St. Paul." Their special duties were to attend the sick, to preach, to instruct the young, and to take the charge of souls. They soon established themselves in Italy, France, Austria, and Spain and enjoyed the privilege of teaching theology in the schools of Milan and Pavia. Many eminent men have been sent forth by them. Besides the three usual monastic vows, they took a fourth, viz., not to sue for church preferments, or to hold any post outside of their order without the Pope's special permission. In France and Austria they were employed in the conversion of Protestants and engaged in missions in China and Burma. They were expelled from France in 1880, but still exist in Belgium, Austria, and Italy.

BARNABY, SIR NATHANIEL (1829-). An English naval architect. He was born at Chatham of a family long associated with the Royal Dockyard in that city. He was educated at Chatham, Sheerness, and Portsmouth, where in 1848 he received the admiralty scholarship. He took part in planning nearly all the war vessels constructed between 1855 and 1885 and was one of the founders of the Institution of Naval Architecture (established 1860). He introduced the change from iron to steel in English shipbuilding in 1872 and advanced the plan of subsidizing merchant vessels for use in war. In 1885 he was made a K.C.B. His principal publication is *Abridgments of Specifications Relating to Shipbuilding, etc., from 1618 to the Present Time* (1862).

BARNABY RUDGE. One of Dickens's novels (1841). It contains an account of the Gordon Riots in London, June 2-7, 1780. The principal character is a half-witted man, who gives the book its name. He is condemned to death as a rioter, but is finally reprieved.

BARNACLE. A popular name for the crustaceans of the order Cirripedia, notable for the fact that in their adult form they are always attached to some foreign object, such as ship bottoms, wharf piles, floating timbers, rocks, or even whales, or else live parasitically within other crustaceans. The ultimate origin of the word "barnacle" is unknown, but it was originally applied to the barnacle goose of northern Europe, and its transfer to these crustaceans was due to the fables formerly current in regard to the reproduction of the bird. (See **BARNACLE GOOSE**.) Considering the popular ignorance, both of the breeding habits of the geese and of the structure of barnacles, it is not extraordinary that the absurd tales in vogue should have found credence, the crustaceans be regarded as the young of the birds, and the name be transferred to them. Goose barnacles (*Lepas*) were thus the first cirripeds to which the name was applied, and in Great Britain it is even now restricted to them and to similar stalked forms. Elsewhere, however, the name "barnacle" is now used for the sessile forms also, and even more broadly as the English term for all cirripeds.

Structure. Barnacles may be broadly defined as attached or parasitic crustacea, with an indistinctly segmented body, surrounded by a mantle, which generally calcifies and forms more or less of a shell or case. As they are attached by the head end, the first pair of antennæ (adhering organs) are very minute, and the second pair are reduced. There are generally six pairs (less frequently three or four) of long, biramous, tendril-like feet, though in parasitic forms these are wanting. There are no heart and no blood vessels, and gills and other organs of respiration are therefore naturally wanting. Barnacles are generally hermaphroditic, but in some species dwarf males occur, living in the mantle cavity of the normal individuals. In a few species the sexes are separate and dimorphic. In their development barnacles undergo a most remarkable and very characteristic metamorphosis. The eggs hatch as minute, somewhat triangular larvæ, with three pairs of limbs, and a projecting horn or process on each side anteriorly. On the under side of the head is a prominent upper lip. This larva sheds its skin several times as it grows, and finally appears as a larger, but still actively swimming creature, provided with a bivalve shell, like that of a clam. The body is segmented, and there are six pairs of biramous feet. The antennæ are modified to serve as organs of adhesion, and a "cement" gland is formed and opens in their second joint. This larva attaches itself by these antennæ, and after a resting or pupa stage becomes transformed into the adult barnacle, as a caterpillar changes into a butterfly. There is this important difference between the two processes, however, that a butterfly does not grow, its size being no greater at death than when hatched, while barnacles continue to grow throughout life.

Classification. Barnacles are classified upon the manner of life and the method of attachment. The order Cirripedia is divided into five families, as follows:

1. Lepadidæ, having the head end elongated to form a flexible stalk.

2. Balanidae, without a stalk, but having the body surrounded by a ring of calcareous plates.

3. Alcippidæ, without stalk, or ring of plates, only three or four pairs of feet.

4. Proteolepadidæ, without stalk, plates, or feet.

5. Kentrogonidæ, without stalk, plates, feet, mouth, or digestive system.

The last three of these families are parasitic, and their reduced structure is directly traceable to their mode of life. The anatomy and natural history of barnacles can be most clearly stated by treating each family separately, though it may be said once for all that all barnacles are marine, except a single brackish-water species of *Balanus*.

The Lepadidæ take their name from the Greek word *λεπάς*, a limpet, probably with reference to their being attached forms. The head end is more or less elongated to form the stalk by which the animal is attached. This stalk is fleshy, but tough and flexible; its length varies greatly, up to 10 or 12 inches. Within it are contained the cement gland, with its duct opening at the tip, and near the base the ovary, with oviduct opening above in the mantle cavity. The oral portion of the head, the trunk, and the appendages are contained within the mantle, which forms a laterally flattened sac, opening by a slit-like aperture at the upper or outer end, on the ventral side. The mantle is chitinous, but contains, deposited in its wall, the plates of lime which compose the shell. There are five of these plates, a median unpaired one (the *carina*) on the dorsal side, an anterior one on each side (*scuta*), and a posterior one to each side (*terga*). There may also be small accessory plates on each side. The animal is so placed within the mantle that the mouth opens on the upper side of the attached end, the trunk curving backward and upward, and bearing the curious tendril-like feet on the ventral side. These feet are thus above the mouth, and in life project more or less freely from the opening of the shell; they are very flexible, and by their movements are continually bringing particles of food into the mantle cavity and down to the mouth. There is a liver or digestive gland connected with the stomach, but a large part of the trunk is occupied by the male reproductive organs. On the ventral side of the body is a strong muscle, by means of which the shell can be tightly closed. The nervous system consists of a brain and a ventral cord; but sense organs, other than those of touch, seem to be wanting in all adults, though eyes are present in the larvæ. The Lepadidæ are very widely distributed, but occur chiefly in the warmer seas. They are popularly known as goose barnacles or goose mussels, the latter name referring to the superficial resemblance they have to the mollusks known as mussels (q.v.). Although this resemblance is very slight, barnacles were long classed as mollusks because of the presence of a shell. The number of species of goose barnacles is not large; but, owing to their becoming attached to the bottoms of ships, they are transported from one side of the globe to the other, so that the same species sometimes occurs in the harbors of Europe, Asia, Africa, Australia, and both coasts of America. Naturally, those which attach themselves to rocks or other fixed bodies have a much more restricted range. None of the Lepa-

didæ are of large size; the body is usually under an inch in length, though the stalk is sometimes 10 times as long. The colors are generally inconspicuous—the stalk and mantle pale brown, the calcareous plates pearly blue. None of the Lepadidæ have any economic value.

The *Balanidæ* take their name from the Greek word *βάλανος*, an acorn, in reference to the shape of the shell. In Great Britain these barnacles are usually called "acorn shells," but the name is not in common use in the United States. The shell is much more fully developed than in the Lepadidæ, and owing to this and the absence of a stalk, they differ superficially from that family to a marked degree. The mantle forms a truncated conical sac, attached by the base, and opening at the upper or posterior end. This opening can be closed by four plates which correspond to the scuta and terga of the goose barnacles. The mantle itself calcifies into six or more vertical plates, which are broadest at the base and which can be more or less drawn together at the top, over the scuta and terga. The internal anatomy is very similar to that of the preceding family, but the ganglia of the ventral nerve cord are fused into a single large ganglionic mass. The *Balanidæ* are even more widely distributed than the Lepadidæ and are more abundant in the colder oceans. They often incrust rocks, wharf piles, and other submerged timbers, and the bottoms of boats, and are frequently found on crabs, mollusks, and other marine animals. They are generally small, less than 2 inches in height; but the largest-known barnacle is *Balanus patulus*, which is sometimes 9 inches high and 4 inches in diameter. This species is of additional interest from the fact that large quantities are gathered on the coast of Chile for food and export. Other species are also eaten, especially by the Chinese, and the Romans regarded some of the Mediterranean forms as great delicacies. The flavor is said to be like that of other crustaceans, as shrimps, lobsters, etc. The shells of the *Balanidæ* are very hard, and when clean are almost pure white.

The *Alciippidæ* are a very small family of minute species, which live in burrows in the shells of mollusks and some of the larger cirripeds. The mantle lines the burrow and is attached at one side by a horny disk. The sexes are separate, and the females are much larger than the males, which are generally found living within the mantle cavity of the females, but it is not certain that they remain there through life.

The *Proteolepadidæ* are a still smaller family. The species are minute, maggot-like animals, with no limbs, parasitic in other crustaceans. So degenerated is the adult female by its parasitic life, that its body consists only of a sac containing the reproductive organs, attached to the crab by numerous fine root-like processes. On account of these, which have arisen from the head of the young, these animals are also known as *Rhizocephala*, or 'root-headed' animals. The best-known genus is *Succulina*, which has long stood as the extreme example of the degenerating effect of a parasitic life. The members of these last two families of barnacles would never be recognized as cirripeds at all from a study of their anatomy alone. But the study of their embryology and the knowledge of their life histories have revealed clearly their ancestry and relationship; for in early life the larvæ of both these families show the same essential characters as the larvæ of other barnacles, and it is only

after they have taken up their abode in their host that the degeneration becomes marked. In *Succulina* the males never become attached to a host, but remain in the larval condition throughout life, except for the development of the reproductive organs.

Barnacles have a special historical interest to every biologist, from the fact that the only extensive systematic work in zoölogy done by Darwin was done upon this group. The classical volumes entitled "monographs" of living and fossil Cirripedia, by Charles Darwin, published by the Ray Society of London in 1851-54, will always be invaluable to students of the Crustacean. Darwin spent eight years on this work, and it illustrates admirably his patience, thoroughness of investigation, and clearness of expression. Another important work on barnacles is part xxviii of the *Challenger* reports; Hock, *Report on the Cirripedia Collected by H. M. S. Challenger* (London, 1884); Pilsbury, "On the Classification of Scalpelliform Barnacles," *Proceedings, Academy of Natural Sciences of Philadelphia* (Philadelphia, 1908); *Barnacles of Japan and Bering Sea* (London, 1911).

BARNACLE. LORD DECIMUS TITE. The extremely self-sufficient nobleman who, with his two sons, Clarence and Ferdinand, is in charge of the "Circumlocution Office" (q.v.), in Dickens's *Little Dorrit*.

BARNACLE EATER. See FILEFISH.

BARNACLE (prob. *vernicle*) GOOSE. A goose (*Branta leucopsis*), common in northern Europe and Greenland, but rare in North America. The name arose from the fables of former days, which represented it as developing from a stalked or "goose" barnacle. In size the barnacle goose is smaller than the common wild goose, being only a little more than 2 feet long and weighing about 5 pounds. It is very prettily marked, having the forehead, cheeks, and throat white, the bill black, and a black stripe extending from it to the eye; the crown of the head, neck, and upper part of the breast black; the rest of the plumage, on the upper parts of the body chiefly ash-gray and black in undulating bars, on the lower parts white. This fowl is migratory in Great Britain and most of northern Europe, appearing in the fall and wintering, but passing northward to the Arctic regions to breed. It is much sought after by hunters and is highly esteemed for the table. Several other species of goose are closely allied to the barnacle and are often confounded with it, notably the brants (q.v.). In northern Asia the barnacle goose is replaced by the red-breasted goose (*Branta ruficollis*), a beautiful bird, the neck and upper part of the breast of which are of a rich chestnut-red. It is somewhat smaller than the barnacle goose and is rarely seen in Europe.

The Story of Barnacles and Geese referred to above is one of the most curious in the chronicle of superstition. It appeared, at least earlier than the eleventh century, in two forms—one that certain trees, always growing in the water, produced fruit, in form like apples, each containing the embryo of a goose, which, when the fruit was ripe, fell into the water; the other that geese were bred from a fungus growing on floating timber, in which they developed as a worm. The "fruit" and "worms" were quickly identified with barnacles that fastened themselves upon floating timber and trees, and many writers declared that they saw the birds inside the shells. Holinshed gravely affirms that such

BARNACLES

1. SESSILE OR ACORN BARNACLE (*Balanus*).
2. PARTS OF A BARNACLE: "sc", outer shell with its parts; "sc", scutum; "f", tergum; "o", ovaries; "f", feet; "a", thoracic appendages.
3. GOOSE BARNACLE (*Lepas anatifera*).

4. EARLY LARVAL, OR "NAUPLIUS" STAGE OF A BARNACLE.
5. LATER LARVAL OR "CYPRIS" STAGE.
6. A MEDIAEVAL PICTURE OF THE SUPPOSED BIRTH OF GEESE FROM BARNACLES REPRESENTED AS FRUIT OF A TREE.

was the case; and the most learned men of their time were weak enough to give credence to the absurdity. Gerard, in his *Herbal* (1597), declares that after "a thing in form like a lace of silke finely woven, as it were, together"—which he correctly enough states to be "the first thing that appeareth" when "the shell gapeth open"—there next follow "the legs of the bird hanging out"; and at last the bird, increasing in size, "hangeth only by the bill," and "in short space after it cometh to full maturity, and falleth into the sea, where it gathereth feathers, and groweth to a fowl bigger than a mallard, and lesser than a goose," etc. An illustration of the process, reproduced from one of the old *Herbals*, will be found on the Plate of BARNACLES.

All this was represented as constantly taking place on the coast of Lancashire and the Hebrides, while other writers reported the same fabulous birth of geese on the Continent.

One extraordinary and laughable result of this belief was the very learned discussion which took place among theologians as to whether the geese so born were flesh or fish. To the Jews it was important, because the ceremonial manner of killing would be different, if they were fowls, from that if they were fish. The Church wished to settle it in order to know if they might be eaten, as could fish, on Fridays and fast days. Very high dignitaries took part in the decision of the question, which in the case of the Church was favorable to their being eaten when meat was forbidden; and it has been suggested that the astonishing persistence of this myth was largely due to the selfish influence of the priests, based on regard for this privilege. What was the origin of so *bizarre* a story has been widely discussed. Many theories have been propounded, none of them satisfactory. The latest student of the matter, Mr. Henry Lee, of the Zoological Society of London, suggests that "barnacle" (or bernicle) as applied to the cirriped, and the same term as applied to the bird, have nothing to do with each other and originated separately. The former is probably a modified diminutive of the Latin *perna*, while the latter originated in the vernacular of Scotland. "To arrive at the origin of the word . . . we must remember," says Lee (*Sea Fables Explained*, London, 1883), "that this bird, *Anser leucopsis*, was formerly called 'brent,' 'brant,' or 'bran' goose [see BRIANT], and was supposed to be identical with the species (*Anser torquatus*) which is now known by that name. The Scottish word for 'goose' is 'clake,' or 'clakes,' and I think that the suggestion made long ago (Gesner, 1558), by his correspondent Joannes Caius, is correct, that the word 'barnacle' comes from 'branclakis,' or 'barn-clake'—the dark-colored goose. . . . I agree with Dr. John Hill (*History of Animals*, London, 1752), that the whole matter that gave origin to the story is that the 'shell-fish' (cirripedes) supposed to have this wonderful production . . . have a kind of fibres hanging out of them, which, in some degree, resemble feathers."

BARNARD, LADY ANNE (1750–1825). The author of the ballad, "Auld Robin Gray" (q.v.). She was born in Fifeshire, Scotland, the eldest daughter of James Lindsay, Earl of Balcarres. In 1793 she married Andrew Barnard, son of the Bishop of Limerick, and secretary to Lord Macartney at the Cape of Good Hope. There Lady Anne lived until 1807, when, on the death of her husband, she returned to London.

Her *Letters*, which were published in 1901, are extremely vivacious and entertaining.

BARNARD, DANIEL DEWEY (1797–1861). An American lawyer, born in Sheffield, Mass. He graduated at Williams College in 1818, and in 1821 was admitted to the bar at Rochester, N. Y. He was a member of Congress in 1828–30 and 1839–45 and also served in the State Legislature. From 1849 to 1853 he was Minister to Prussia. He published numerous speeches and reviews.

BARNARD, EDWARD EMERSON, LL.D. (1857–). An American astronomer. He was born at Nashville, Tenn., graduated in 1887 at Vanderbilt University (Nashville), and in 1887–95 was astronomer at Lick Observatory, Mount Hamilton, Santa Clara Co., Cal. Subsequently he became professor of astronomy at the University of Chicago and astronomer of the Yerkes Observatory, Williams Bay, Wis. He received, in 1892, the Lalande gold medal of the French Academy of Sciences; in 1898 was elected a foreign associate of the Royal Astronomical Society of Great Britain; was awarded the Janssen gold medal by the French Academy of Sciences (1900); and the Janssen prize by the French Astronomical Society (1906). He obtained excellent results in celestial photography and discovered 16 comets and the fifth satellite of Jupiter. In 1902 he published *Micrometrical Observations of Eros Made during Opposition of 1900–1901*.

BARNARD, FREDERICK AUGUSTUS PORTER (1809–89). An American mathematician and educator. He was born at Sheffield, Mass., graduated at Yale in 1828, and in 1831 became teacher in the Hartford Deaf and Dumb Asylum. He was professor of natural philosophy, mathematics, and English literature in the University of Alabama from 1837 to 1848 and of chemistry until 1854, when he took orders in the Episcopal church. In 1855 he was professor of astronomy and mathematics in the University of Mississippi, in 1856 president of that institution, and in 1858 chancellor. He became president of Columbia College, New York City, in 1864, and throughout nearly a quarter-century labored with great success for its advancement. He was United States Commissioner to the Paris Exposition of 1867 and to that of 1878 and in 1869 published a report on machinery and industrial arts. He wrote a *Treatise on Arithmetic* (1830), *Analytical Grammar with Symbolic Illustrations* (1836), *Letters on College Government* (1854), *Collegiate Education* (1854), *Art Culture* (1854), *History of the United States Coast Survey* (1857), *University Education* (1858), *Recent Progress of Science* (1869), *The Metric System* (1871), and contributed very extensively to the educational periodicals of his day. In 1860 he was one of the party sent to Labrador to observe an eclipse of the sun; in 1862 he was at work on the reduction of Gillis's observations of the stars of the Southern Hemisphere, and in 1863 he superintended the publication of maps and charts of the United States Coast Survey. He was one of the incorporators of the American Association for the Advancement of Science and its president in 1860; one of the incorporators of the National Academy of Sciences in 1863; a member of the board of experts of the Bureau of Mines in 1865, and a member of the American Institute in 1872. In the latter year he was editor in chief of *Johnson's Universal Cyclopædia*. He left the bulk of his property

to Columbia College. Barnard College, affiliated with Columbia University, is named after him—so named because of the interest which President Barnard took in the higher education of women. Consult Fulton, *Memoirs of Barnard* (New York, 1896); Winship, *Great American Educators* (Chicago, 1900); Van Amringe, *A History of Columbia University* (New York, 1904); and Sherwood, "Columbia University" in United States Bureau of Education, *Circulars of Information*, 1900, No. 3.

BARNARD, GEORGE GREY (1863–). An eminent American sculptor. He was born at Bellefonte, Pa., and derived his earliest training at the Art Institute of Chicago. He then studied for three years at the Ecole des Beaux-Arts, and for nine years in his own studio, in Paris. In 1894 he first exhibited at the Champs de Mars, upon which he was elected an associate of the Société Nationale des Beaux-Arts. In 1896 he removed to New York. The principal work of his early period is "The Two Natures," (1904), in the Metropolitan Museum of Art, New York. Other important productions are: "Sleeping Boy"; "Friendship" (a colossal group for a tomb in Norway); "The Flowers"; a clock-case, 12 feet high, carved in oak and illustrating Scandinavian mythology, a remarkable production; "Maidenhood," a marble of charming purity; the bronze "God Pan," on the green of Columbia University, New York; a large fountain in Tampa, Fla., and another at Cairo, Ill. His later commissions include the memorial of Governor Curtin and the soldiers of Centre County at Bellefonte, Pa., and the entire sculpture of the new State Capitol of Pennsylvania. Barnard was awarded gold medals at the Paris and Pan-American expositions and became professor of sculpture in the Art Students' League and an associate of the National Academy of Design. His work reveals a striking originality of conception and admirable technique, especially in marble. His sculpture, like the painting of Watts, is symbolic and idealistic. Consult Taft, *History of American Sculpture* (New York, 1903).

BARNARD, HENRY (1811–1900). An American educational reformer. He was born at Hartford, Conn., graduated at Yale in 1830, and was admitted to the bar in 1835. From 1837 to 1840 he was a member of the State Legislature, where his career was marked by his energy in behalf of school and prison reform. Later, as school commissioner of Rhode Island (1843–49), he manifested the same zeal and virtually revolutionized the educational system of that State. From 1850 until 1854 he was superintendent of the Connecticut State schools; during the same period principal of the State Normal School at New Britain; from 1857 to 1859 president of the University of Wisconsin from 1865 to 1866 president of St. John's College, Annapolis; and from 1867 to 1870 the first United States Commissioner of Education. He organized the Bureau of Education and in his reports suggested or advocated nearly all of the reforms that have since been carried out in our educational system. Dr. Barnard, while secretary of the Connecticut School Board (1832–42), and later while superintendent, published the *Connecticut Common School Journal* and, while in Rhode Island, the corresponding journal in that State. In 1855 he founded the *American Journal of Education*, continuing as editor and chief con-

tributor until 1886, when he published the *American Library of Schools and Education*, a collection of his own treatises numbering over 800 and filling 52 volumes. Dr. Barnard is to be ranked with Horace Mann as one of the greatest of American educational pioneers. Consult A. D. Mayo, *Henry Barnard* (Washington, 1898), and W. S. Monroe, *Educational Labors of Henry Barnard* (Syracuse, 1893).

BARNARD, JOHN GROSS (1815–82). An American officer and military engineer. He was born in Sheffield, Mass., graduated at West Point in 1833, and was employed as constructing engineer until 1846, rising to the rank of colonel of engineers and brevet major general. In the Mexican War he fortified Tampico and in 1851 was chief engineer of the Tehuantepec Survey. He was superintendent of West Point from 1855 to 1856 and for four years was in charge of the defenses of New York Harbor. In the Civil War he served successively as chief engineer of the department of Washington, as chief engineer (with the rank of brigadier general) of the Army of the Potomac, and chief engineer of the staff of General Grant. At the close of the war he was brevetted major general "for gallant and meritorious services in the field," and in December, 1865, became colonel of the Engineer Corps. He subsequently was a member of the boards having charge of fortifications and river and harbor obstructions. He published, among other works: *Phenomena of the Gyroscope* (1858); *Dangers and Defenses of New York* (1859); *Notes on Sea-Coast Defense* (1861); *The Confederate States Army and the Battle of Bull Run* (1862). Consult *Biographical Memoirs of the National Academy of Sciences* (1905).

BARNARD CASTLE. A market town in the county of Durham, England, situated on the Tees, 15 miles northwest of Darlington. On a rocky promontory near the river are the ruins of a castle built in the thirteenth century by Barnard Bahol, an ancestor of John Baliol, King of Scotland. Its townhall is noteworthy, and here are also a museum and a number of manufacturing establishments. It has a large grain market. Pop., 1901, 4421; 1911, 4757.

BARNARD COLLEGE. The undergraduate college for women in the educational system of Columbia University (q.v.). The college proper was organized in 1889, as a result of the failure of President Barnard of Columbia and others to induce the trustees of Columbia College to admit women to that institution upon equal terms with men. The woman's college, then formed, had its own trustees and financial responsibility, but was closely affiliated with Columbia. The arrangement made at that time to exchange instructions was soon outgrown, and on Jan. 9, 1900, the following agreement was made: The president of the university to be ex officio president of Barnard and a trustee of Barnard; the internal administration of Barnard to be conducted under the direction of the president by its dean (Miss Virginia C. Gildersleeve, Ph.D., 1911–), who is entitled also to a vote in the university council; Barnard to retain its separate corporate existence and board of trustees, to provide for its own financial support, and to maintain complete separate undergraduate instruction; all Barnard degrees to be granted by, and in the name of, Columbia. At first Barnard College had charge of the women post-graduate students of the university, but since 1900 these students have registered directly in the university.

Although, as originally organized, Barnard had no further financial resources than the promise of a number of persons to pay a small sum annually for four years, it has been able, through subsequent subscriptions, to meet all the expenses of a rapidly growing college. In 1889 there were 36 students; in 1891-92, 62; in 1901-02, 431; in 1906-07, 624, and in 1911-12, 845. The buildings of the college are on Broadway, adjoining those of the Columbia corporation, and include Milbank Hall, the gift of Mrs. A. A. Anderson; Fiske Hall, given by Mrs. Josiah M. Fiske; and Brinckerhoff Hall, built mainly by the gifts of Mrs. Van Wyck Brinckerhoff. In March, 1902, the endowment of the college was increased by \$500,000, \$250,000 being given by John D. Rockefeller and \$250,000 being obtained through numerous other gifts. In 1903 Mrs. Anderson provided for the future development of the college by the gift of the land lying between Broadway and Claremont Avenue and 116th and 119th streets, now known as Milbank Quadrangle. From a fund of \$50,000 given in 1902 by Mrs. Anderson, to which, in 1906, an unknown donor added \$150,000, a dormitory, Brooks Hall, was erected on 116th Street, which is to be one of a series of five dormitories facing on Milbank Quadrangle. The endowment of the college is about \$1,300,000; the value of the buildings and grounds, about \$3,000,000. The gross income is about \$200,000.

BARNARDO, THOMAS JOHN (1845-1905). An English philanthropist, born in Ireland. While engaged in the study of medicine at London Hospital in 1866, he became interested in the condition of destitute children and established a place of refuge for them in Commercial Road in 1867. Since then 112 of these homes and many mission branches had been opened in various parts of England, Canada, and the Island of Jersey at the time of his death. In the "Village Home" at Ilford, Essex, about 65 cottages have been erected. These are under the supervision of "mothers," and girls are reared here as if they were in their own homes. There is also an emigration agency, which provides for the transportation of young people to Canada, where they are furnished with employment. In this way more than 60,000 orphan waifs have been rescued and instructed. Among the publications of Barnardo are: *Something Attempted, Something Done*; and *The Rescue of the Waif*. Consult J. H. Batt, *Dr. Barnardo: the Foster-father of "Nobody's Children"* (London, 1904); also a biography by his wife (1907).

BAR/NARD'S INN. An inn of Chancery, in London, dating back to 1451. It was destroyed in the last decade of the nineteenth century to make room for modern buildings.

BARNATO, BARNETT (1852-97). An English speculator, the so-called "King of the Kaffirs," commonly known as Barney Barnato. He was born in London, of Hebrew parentage. Early in his career he was connected with a circus and with traveling theatrical companies. In 1873 he went to Kimberley, South Africa, and in 1895 organized a remarkable "boom" in Kaffir mining stock. He was credited with being one of the richest men in the world and the most successful promoter of financial schemes. He committed suicide in 1897 by jumping from a vessel at sea. Consult Isaacs, *Life of Barnett Barnato* (London, 1897).

BARNAUL, bär'nä-ool'. The capital of a

district in the government of Tomsk, Siberia, on the left bank of the upper Ob, 238 miles southwest of Tomsk, and 2046 miles east-southeast of Moscow (Map: Asia, H 3). It is the chief town and the administrative seat of the personal domains of the Czar in the Altai, and contains the Imperial smelting works, the annual output of which exceeds 13,000 pounds of gold and 5000 pounds of silver (troy). The district is rich in minerals, producing large quantities of lead, copper, iron, and silver. Barnaul's notable institutions are a meteorological station, founded in 1838, a well-equipped mining school and library, a mint, and a public museum, with fine zoölogical and botanical collections. Pop., 1897, 29,408.

BARNAVE, bär'näv', ANTOINE PIERRE JOSEPH MARIE (1761-93). A champion and victim of the French Revolution. He was born at Grenoble, the son of an advocate. He adopted his father's profession and early attracted attention in the Parlement of Grenoble by the talents which he displayed. A pamphlet which he published against the feudal system led to his being returned as deputy from his province to the States-General in 1789. He zealously advocated the proclamation of the Rights of Man, was vehement in opposition to the absolute veto, carried through the confiscation of church property to the use of the nation, the emancipation of the Jews, and the abolition of the religious orders, and was mainly instrumental in the liberation of the slaves and reorganization of the colonies. He was the leading member of the Jacobin Club for the first two years of its existence. As a leader of the extreme party in the earlier stages of the Revolution, he became the idol of the people, particularly after his victory over Mirabeau in the question of the power of peace and war, which Mirabeau wished to leave with the King, and Barnave successfully claimed for the National Assembly. With Pétion and Latour-Maubourg he was sent to bring the royal family back from Varennes, where they had been intercepted on their flight to the border. It may be that personal contact with royalty softened his prejudices; but certainly it is true that he subsequently became inclined to a more moderate course, defended the inviolability of the King's person, and resisted the assertion by the National Assembly of power to remove ministers. This conduct led to his being regarded as a renegade from the National party. He retired to his native place on the dissolution of the National Assembly, but after the 10th of August, 1792, he was impeached, with Lameth and Duport-Dutertre, on account of correspondence with the court; was brought to Paris, tried before the Revolutionary tribunal, condemned, and guillotined on the 29th of November, 1793. Consult Janin, *Barnave* (Paris, 1860).

BARNAY, bär'nä, LUDWIG (1842-). A German actor, born at Pesth. He made his début in 1860 at Trautenau and appeared in his native city the following year, after which he had engagements of varying length in Gratz, Mainz, Vienna, Prague, Riga, Mainz again, Leipzig, and Weimar. From 1870 to 1875 he was at the Stadt-Theater of Frankfort-on-the-Main, and for the next five years at that of Hamburg, where he acted as director. For several years thereafter he traveled as a "star," visiting London with the Meiningen Court Company in 1881, and in 1882 making a successful tour in the United States. From 1887 to 1894 he managed

his Berliner Theater in Berlin. He has since made his home in Wiesbaden. Barnay's greatest talents have been shown in tragedy. Among his most noted rôles are Essex, Uriel Acosta, Othello, Antony, Tell, and Egmont. He was the leader in the movement which assembled the stage congress at Weimar in 1871, thus being founder of the "Association" (*Bühnengenossenschaft*), which has proved of such value to the German theatrical profession.

BARNBURNERS. In American political history, a faction of the Democratic party in New York State after 1844, so called (in allusion to a Dutchman who was said to have burned his barn to free it of rats) from their supposed eagerness for radical reform measures, especially for such measures as would prevent the extension of slavery in the Territories. Unable to secure satisfactory recognition in the Democratic National Convention of 1848, they joined the Free-soilers, and with them nominated Van Buren for the presidency. Their vote, dividing the Democratic strength, secured the election of Taylor, the Whig nominee. In 1852 they reunited with their opponents, the Hunkers, though the two factions did not work together in harmony until several years later. Before this time the name "Softs," or "Soft-shells," had replaced the name "Barnburners." See VAN BUREN, MARTIN; HUNKERS; ALBANY REGENCY.

BARNBY, SIR JOSEPH (1838-96). An English musician and composer. He was born at York, England, and was educated at the Royal Academy of Music. He was organist at St. Andrew's and St. Ann's, was conductor of the oratorio concerts at St. James's and Exeter Halls; succeeded Gounod as conductor of the Royal Albert Hall Choral Society in 1872; became musical director at Eton College in 1875, and afterward was elected principal of the Guildhall School of Music. In 1892 he was knighted. Among his numerous and popular compositions the motet, *King All Glorious*, and his oratorio, *Rebekah*, and *The Lord is King*—a setting of the 97th Psalm—are especially noteworthy.

BARN'DOOR' SKATE. The largest of North American skates (*Raja laris*). It occurs along the Atlantic coast from New England to Florida, and may reach a length of 4 or 5 feet. See SKATE.

BARNEGAT BAY. An inlet of the Atlantic, in Ocean Co., N. J., extending from Bayhead to New Inlet. It is 27 miles long and 1 to 4 miles wide. It is separated from the ocean by Island and Long beaches. On the north end of the latter is Barnegat City (Map: New Jersey, D 4). The beaches are separated by Barnegat Inlet, about 1 mile wide. At the mouth is a lighthouse, 39° 45' 52" N., 74° 6' 24" W., with a light 163 feet above sea level, flashing white every 10 seconds and visible 19 nautical miles.

BARNES, ALBERT (1798-1870). An American Presbyterian theologian. He was born at Rome, N. Y.; graduated at Hamilton College and the Princeton Theological Seminary. He was pastor of the First Presbyterian Church, Philadelphia, from 1830 to 1867, and is best known for his *Notes on the Bible*. Of the *Notes on the New Testament* over a million copies were sold. During the disruption of the Presbyterian church he was tried for heresy and in the final separation went with the New School and was among the most liberal of its leaders. Besides the *Notes*, he wrote an introduction to *Butler's*

Analogy; Scriptural Views of Slavery (1846); *The Way of Salvation* (1863); *Lectures on the Evidences of Christianity in the Nineteenth Century* (1868), and a series of Sunday-school manuals. A collection of his *Theological Works* was published in Philadelphia (1875).

BARNES, ALFRED SMITH (1817-88). An American publisher, born at New Haven, Conn. He entered the publishing business in Hartford, Conn., at an early age, and afterward went to New York (1838) and there published many of Professor Davies's mathematical works. He lived in Philadelphia from 1840 to 1845 and then settled permanently in New York and undertook the publication of schoolbooks. At his death Mr. Barnes left nearly \$100,000 to educational and charitable institutions, \$45,000 of it going to the construction of Barnes Hall, the home of the Christian Association of Cornell University.

BARNES, BARNABE (c.1569-1609). An Elizabethan lyricalist, son of Dr. Richard Barnes, Bishop of Durham. He was educated at Oxford, was with Essex in Normandy against the Prince of Parma (1591), and took the side of Gabriel Harvey in the quarrel with Thomas Nash. In 1593 Barnes published a volume containing much beautiful verse, *Parthenophil and Parthenophe: Sonnettes, Madrigals, Elegies, and Odes* (reprint by Arber in *English Garner*, 1882); *A Divine Centurie of Spirituall Sonnets* (1595; ed. by Grosart, 1875) is less interesting. His rather remarkable and somewhat *outré* tragedy, *The Devil's Charter*, was performed before King James at Christmas, 1606-07.

BARNES, CHARLES REID (1858-1910). An American botanist, born at Madison, Ind. He received his education at Hanover College and subsequently studied botany at Harvard. In 1880 he was made professor of natural history at Purdue University and in 1886 professor of botany at the University of Wisconsin. In 1898 he became professor of plant physiology at the University of Chicago. He was made vice president of the American Association for the Advancement of Science in 1899 and president of the Botanical Society of America in 1903. Besides editing the *Botanical Gazette*, he wrote: *Handbook of Plant Dissection* (jointly with J. M. Coulter and J. C. Arthur, 1886). *Keys to the Genera and Species of North American Mosses* (1st ed., 1890; 2d ed., jointly with F. D. Heald, 1897); *Plant Life* (1898); *Outlines of Plant Life* (1900); *Textbook of Botany* (jointly with J. M. Coulter and H. C. Cowles, 1910); and a number of valuable papers on botanical subjects.

BARNES, EARL (1861-). An American lecturer and educator, born at Martville, N. Y. He received the degree of A.B. from Indiana University in 1889 and that of M.S. from Cornell two years later. In 1890-92 he was professor of European history at Indiana University, and from then until 1897 he held the chair of education at Leland Stanford, Jr., University. Subsequently he devoted his time to lecturing and writing. Among his books are: *Studies in Education*, vol. i (1889), vol. ii (1902); *Studies in American History* (1896); *Woman in Modern Society* (1912).

BARNES, HOWARD TURNER (1873-). A Canadian physicist. He was born at Woburn, Mass., but went to Canada with his parents in 1879. An early private education was succeeded by a course at McGill University, from

which he graduated in 1893. His research work in physics was recognized by the Royal Society, London, in 1898, when he was awarded the Joule studentship by that institution. He was appointed Macdonald professor of physics in McGill University in 1908, succeeding in that position Ernest Rutherford. The formation of ice in flowing water, and the ice problem considered with reference to engineering work in Canada were investigated by him. He invented improvements in thermometer construction, perfected a pyrometer which is used in the regulation of furnaces in factories, and he published *Ice Formation and Frazil* (1910).

BARNES, JAMES (1806-69). An American soldier, born in Boston, Mass. He graduated at the United States Military Academy in 1829 and was assistant instructor in French there in 1829-30. Subsequently he was in garrison at Forts McHenry (Md.) and Monroe (Va.). With the rank of first lieutenant of artillery he resigned and was engaged in railway engineering from 1836 to 1857. During the Civil War he served in 1861-62 as colonel of the Eighteenth Massachusetts Volunteers in the defenses of Washington, and with the Army of the Potomac in the Virginia Peninsular campaign and the Maryland campaign. As a brigadier general of volunteers he was at the battles of Fredericksburg and Chancellorsville and commanded a division at Gettysburg. He was brevetted major general of volunteers in 1865 for meritorious services.

BARNES, JAMES (1866-). An American author. He was born at Annapolis, Md., and graduated at Princeton in 1891. He was with *Scribner's Magazine* for some time, in 1894-95 was assistant editor of *Harper's Weekly*; from 1899 to 1901 was war correspondent for *The Outlook* in South Africa; and from 1905 to 1908 was editor of *Appleton's Booklover's Magazine*. He wrote: *Naval Actions of the War of 1812* (1896); *Yankee Ships and Yankee Sailors* (1898); *David G. Farragut* (1899); *Drake and his Yeomen* (1899); *The Giant of Three Wars* (1903); *The Blockaders* (1905); *Outside the Law* (1906); *The Clutch of Circumstance* (1908); *Rifle and Caravan* (1912).

BARNES, JOSEPH K. (1817-83). An American surgeon. He was born in Philadelphia, Pa., and was educated at Harvard and the University of Pennsylvania. In 1840 he joined the United States army as an assistant surgeon, and at the close of the Civil War was surgeon-general, being brevetted major general (1865). To him was due a large part of the efficiency of the medical department during the war. He was the founder of the Army Medical Museum and the library of the surgeon-general's office. He attended Presidents Lincoln and Garfield on their deathbeds.

BARNES, JOSHUA (1654-1712). An English classical scholar, born in London. In 1695 he was appointed Regius professor of Greek at Cambridge. Among his best-known works are: *Gerania*; or, *A New Discovery of a Little Sort of People Called Pygmies* (1675), which is said to have furnished to Swift some hints for his *Voyage to Lilliput*; and *Αἰνικακότροπος* (1679), a Greek paraphrase of the biblical story of Esther. His editions of Greek authors—Euripides, Anacreon, Homer—are no longer used.

BARNES, LADY JULIANA. See **BERNERS, LADY JULIANA.**

BARNES, THOMAS (1785-1841). An English editor. He was a schoolfellow of Leigh

Hunt at Christ's Hospital, graduated in 1808 at Pembroke College, Cambridge, and wrote for the London *Examiner* a series of articles published over the signature "Criticus." In 1817 he became editor of the London *Times*, which he established as the foremost of English newspapers. He was a friend of Hunt, Lamb, and Hazlitt; and, as director of the political policy of the *Times*, wielded great influence. "Barnes," says Leigh Hunt in his *Autobiography*, "wrote elegant Latin verse, a classical English style, and might assuredly have made himself a name, in wit and literature, had he cared much for anything beyond his glass of wine and his Fielding."

BARNES, WILLIAM (1801-86). A poet and philologist, born at Rushay, Bagber, Dorsetshire. He was for many years master of the grammar school at Dorchester. He was ordained in 1847 and was promoted from the curacy of Whitcombe to the rectory of Winterbourn-Came, in Dorset, in 1862. In the meantime he received the degree of B.D. from Cambridge. He died Oct. 7, 1886. He is the author of three collections of poems written in the dialect of Dorsetshire: *Poems of Rural Life, with a Dissertation and Glossary* (1844); *Homely Rhymes* (1859); and *Poems of Rural Life* (1893). He wrote also a collection called *Poems of Rural Life in Common English* (1868), which contains many attractive pieces. As a philologist, Barnes attempted to restore the ancient English speech. In his *Outline of English Speechcraft* (1878) he substituted for the usual grammatical nomenclature English compounds of his own coining. "Tenses" became *time-takings*; "adjectives," *mark-words*; and "grammar," *speechcraft*. Consult Lucy Baxter, *Life of William Barnes* (New York, 1887).

BARNES, WILLIAM, JR. (1866-). An American politician. He was born in Albany, N. Y., and graduated from Harvard University in 1888. In the following year he became owner and editor of the *Albany Evening Journal*. He took an aggressive interest in Republican politics, his forceful personality soon making him one of the leading political figures in New York State. In 1892 he became a member of the Republican State Committee, and in 1911 he was elected its chairman. Without being the holder of an elective office, or at any time a candidate for such an office, he virtually directed the course of the Republican party in New York until 1912, when the organization split into progressive and conservative sections. Identifying himself with the conservative wing, Barnes became a delegate to the 1912 National Convention of his party, and there bitterly opposed the attempt to make Theodore Roosevelt Republican candidate for the presidency. After the Democratic landslide of the following autumn he continued to control the "machine" of the regular Republican party in New York.

BARNESBORO. A borough in Cambria Co., Pa., 40 miles west by north of Altoona, on the Pennsylvania Railroad (Map: Pennsylvania, D 6). It is in a coal-mining district and has lumber yards, bottling works, and an ice-cream factory. The borough contains a theatre and several hotels and owns its water works. Pop., 1900, 1482; 1910, 3535.

BARNESVILLE. A town in Pike Co., Ga., 60 miles south by east of Atlanta, on the Central of Georgia Railroad (Map: Georgia, B 2). Barnesville is the seat of Gordon Institute and has a Carnegie library. It carries on a trade in

cotton and manufactures buggies. Pop., 1910, 3068.

BARNESVILLE. A city in Belmont Co., Ohio, 30 miles west by south of Wheeling, W. Va., on the Baltimore and Ohio Railroad (Map: Ohio, H 6). It manufactures glass, car wheels, cigars, bottles, shirts and overalls, and boxes. Barnesville was settled in 1800 and was first incorporated about 1836. The government is vested in a mayor, elected biennially, and a council. The water works are owned and operated by the city. Pop., 1910, 4233.

BARNET. A town in Hertfordshire, England, 11 miles north-northwest of London. Near the town is the site, marked by an obelisk, of the famous battle, fought April 14, 1471, between the Yorkists and Lancastrians, in which the latter, after a desperate struggle, were routed, and their leader, Warwick, "the king-maker," killed. An annual cattle fair is held here. Pop., 1891, 6400; 1901, 8359; 1911, 10,440.

BARNETT, JOHN (originally, BEER) (1802-90). An English composer, born at Bedford. After studying under various masters he early wrote a considerable number of songs and ballads, of which the best was the setting for the Rev. Charles Wolfe's "Burial of Sir John Moore." In 1834 appeared his *Lyrical Illustrations of the Modern Poets*, a song collection of unusual merit; and in the same year his opera, *The Mountain Sylph*, was presented in London. With the latter, many mark the beginning of the movement toward the founding of an English school of dramatic music. His *Fair Rosamond*, performed in 1837, failed, through the absurdities of the libretto, of any marked success. Others of his publications are an oratorio, *The Omnipotence of the Deity* (1830), and a *School for the Voice* (1844).

BARNETT, JOHN FRANCIS (1837-). An English musician and composer, born in London. He studied at the Royal College of Music, London, and the Leipzig Conservatorium; played at a Gewandhaus concert, Leipzig, in 1861, and first attracted attention as a composer by his symphony in A minor, performed in 1864 by the Musical Society of London. His most important work is the cantata, *The Raising of Lazarus*, given for the first time at the Hereford festival of 1876. He became a professor in the Guildhall School of Music and in the Royal College. Among his other works are the cantatas *The Ancient Mariner*, written for the Birmingham festival of 1867, and *Paradise and the Peri*, for that of 1870; *The Lay of the Last Minstrel*, for orchestra; quartets and quintets for strings; and several pianoforte and vocal solos.

BARNEVELDT, HÄRNEVELT, JAN VAN OLDEN (1547-1619). A Dutch statesman. He was born at Amersfoot, in Utrecht, and at an early age showed great ardor in the cause of his country's independence. He was an able ally of William the Silent in the struggle against Spain, and after the Prince's death succeeded, through wise alliances with England and France, in preserving the independence so dearly gained. As Advocate-General of the Province of Holland, he proved equally his insight into public affairs and his address in diplomatic negotiations. Penetrating the secret designs of the young Prince Maurice of Orange, whom he had caused to be made stadtholder of five provinces, he made himself the leader of the Republican party, which aimed at subordinating the stadtholder to the Legislature and saving the Netherlands from a

monarchy. It was he, also, who opposed the warlike tendencies of Maurice and concluded a treaty with Spain (1609) which later saved the country from the horrors of the Thirty Years' War. The country was at that time split up into the rival factions of the Arminians or Remonstrants, who stood for the doctrine of Free Will and comprised the magistracy of the country, with Barneveldt at their head, and the Calvinists, who were known as Gomarists or Contra-Remonstrants, of whom Maurice for political reasons now assumed the leadership. With the view of obviating a civil war, Barneveldt caused an ecclesiastical assembly to be called, which established general toleration. The states at first concurred in this wise measure, but the partisans of the Orange faction brought about a change of views by representing the Remonstrants as secret friends of Spain. Barneveldt was attacked in scurrilous publications and was insulted, even in the meetings of the states, by the mob whose idol Maurice was. The strife between the Remonstrants and the Gomarists, i.e., between Barneveldt and Maurice, finally culminated in violence on the part of the Prince of Orange. On Aug. 29, 1618, Barneveldt was illegally arrested, together with Grotius and Hoogerbeets, and thrown into prison. In November Maurice procured the summoning of the Synod of Dort (q.v.), which condemned the Remonstrants with the utmost rigor. In March, 1619, while the Synod was still sitting, Barneveldt was brought to trial before a special commission of 24 judges, unlawfully appointed, who condemned as a traitor the innocent man to whom the country owed its political existence. The friends of Barneveldt, the Princess of Orange, and the French Ambassador interceded for him in vain. On May 13, 1619, the venerable man was executed. Four years after their father's death, Barneveldt's two sons, Wilhelm and Reinier, took part in a conspiracy against the life of Maurice. The conspiracy was discovered; Wilhelm escaped, but Reinier was seized and beheaded. Consult Motley, *Life of Barneveldt*, of which numerous editions have been published (London and New York, 1874).

BARNEY, JOSHUA (1759-1818). An American naval officer, born in Baltimore, Md. He shipped in 1772 in a brig trading to Liverpool and subsequently made several voyages to Europe. At the outbreak of the Revolutionary War he was appointed master's mate on board the sloop-of-war *Hornet*, which was assigned to Commodore Hopkins's squadron and participated in the capture of New Providence, Bahamas. Subsequently he entered on board the schooner *Wasp* and served on the sloop *Sachem*, the brig *Andrea Doria*, and the frigate *Virginia*. He was captured by the British in 1780 and sent to Mill Prison, Plymouth, England, whence he made his escape in 1781 and came to Philadelphia. In 1782, in command of the *Hyder Ali*, he captured off Cape May the British ship *General Monk* and in the same year sailed for France with dispatches to Franklin, then United States Minister, concerning the peace negotiations. From 1795 to 1800 he was a commodore in the French service; in 1814 commanded the American flotilla in defense of Chesapeake Bay, and in the same year participated in the battle of Bladensburg. Consult Barney, *A Biographical Memoir* (Boston, 1832).

BARNFIELD, RICHARD (1574-1627). An English poet, born at Norbury, Shropshire. His

works include *The Affectionate Shepherd*, a pastoral based on Vergil's Second Eclogue (1594); *Cynthia, with certain Sonnets and the Legend of Cassandra* (1595); and *The Encomion of Lady Pecunia*, etc. (1598). The last volume contains "If music and sweet poetry agree," and "As it fell upon a day," which were long attributed to Shakespeare. They were again printed in *The Passionate Pilgrim* (1599). Barnfield's poems were edited by Grosart for the Roxburghe Club (1876), and by E. Arber (1882).

BARNIVELT, ESDRAS, APOTHECARY. The pseudonym of the author of a key to *The Rape of the Lock*. The "key" has been ascribed both to Pope and to Arbuthnot and was published in London in 1715.

BARN OWL. The barn owl is a familiar species named by Linnæus *Strix flammea*, and conservative ornithologists regard it as almost cosmopolitan in its distribution, counting the slight differences observable in those of Africa, the Orient, Australia, North and South America, as marking merely geographical races; others, however, prefer to separate these local forms into distinct species, and call that of the Americas *Strix pratincola*. The scientific terminology of many of the owls is still an unsettled matter, and while the American ornithologist speaks of his barn owl as *Aluco pratincola*, his British colleague insists on *Tyto alba*. The common names are not free from dispute, and in England the term "barn owl" is most often applied to the related tawny owl (*Strix stridula* or *aluco*), while the present species is usually called "screech owl." This type of owl is of comparatively small size (length, about 17 inches) and is characterized by the yellowish-red, irregularly marked plumage of the back; the "silky-white to bright tawny" hue of the under surface, dotted with black spots; and particularly by the heart-shaped form of the facial disks, which meet in a point below the beak and are fringed with bright rust color. The eyes are small and black, the legs long and clothed with short feathers only. Its quaint physiognomy has won for it the name "monkey-faced" in the Southern States.

Range and Breeding.—This owl is occasionally seen over most of the United States, but is most numerous in the southern portion and thence to Patagonia. It seems to be partly migratory, retreating in winter from its most northerly ranges. In the Old World it breeds mainly in church towers, ruins, and similar places, and its eerie hoot has contributed much to the poetry and fables connected with its race; but in less civilized or less ruinous parts of the world it chooses for a nesting place a cavity in an old tree, a crevice among rocky crags, or (as very frequently in the southwestern United States) a niche in some steep earthen bank. Even in the United States, however, it makes its home in belfries and stone buildings when it can. The nest is a bed of straw and feathers, and the eggs, 4 to 8, are white. "This owl," Fisher remarks, "is one of the most distinctively nocturnal of the tribe, but like all the others it can see perfectly well in the brightest daylight, when for any reason it is required to leave its retreat. It usually sleeps during the day, sitting upright in a dark nook or crevice, in the shadow of a bridge, or among the dense foliage of some grove or reedy marsh."

Food and Economic Value.—This species is perhaps the most beneficial of its tribe to the

agriculturist, because its food consists almost wholly of the small rodents so injurious to him. Naturalists recognize this in all parts of the world. In the United States this owl subsists in the East mainly on rats and wild mice; in the South on the cotton rat, and certain mice doing great injury there; and in the West on gophers, ground squirrels, and rabbits, even those so large as the jack rabbit. Its services in the destruction of cotton rats and pouched gophers alone would entitle it to gratitude and protection. Consult Fisher, *Hawks and Owls of the United States* (Agric. Dept., Washington, 1893). See OWL, and Plate of OWLS.

BARN斯LEY. A town in the West Riding of Yorkshire, England, about 21 miles north of Sheffield, on the Dearne (Map: England, E 3). Although the town is of great antiquity, most of its buildings are of a comparatively recent date. It was incorporated in 1869 and maintains public libraries, baths, and markets. It has a large number of educational and benevolent institutions and a public park of about 20 acres. It is situated within the coal district and has manufactures of linen, paper, glass, and steel wire. There are also iron and steel foundries, grain and saw mills, breweries, and dyeing works. It is on four railway lines and a canal, which facilitates its export of coal, mainly to Hull and London. The United States has a resident consular agent. Pop., 1891, 35,000; 1901, 41,000; 1911, 50,614. Barnsley dates from pre-Norman times. Consult Jackson, *History of Barnsley* (London, 1858).

BARNSTABLE, bärn'sta-b'l. A town and the county-seat of Barnstable Co., Mass., 73 miles by rail southeast of Boston, on Barnstable Bay, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, G 4). It contains 12 villages, several of which are well-known summer resorts, and is principally engaged in boat building, oyster fishing, and cranberry cultivation. Within the town limits are several public libraries and a State normal school. Barnstable was first settled in 1639. In the part called West Barnstable, James Otis, Sr., lived, and James Otis, Jr., was born. The government is administered by town meetings. Pop., 1900, 4364; 1910, 4676. Consult "Annals of Barnstable," in Freeman's *History of Cape Cod* (Boston, 1860-69).

BARNSTAPLE, bärn'sta-pl (locally known as Barum). A town in Devonshire, England, on the Taw, 6 miles from its mouth and 34 miles northwest of Exeter (Map: England, B 5). The Taw is here crossed by a bridge said to have been built in the thirteenth century. It consists of 16 arches and has been widened by ironwork on each side. Its noteworthy buildings are a parish church, dating from the fourteenth century; the old grammar school, at which the poet John Gay was educated; and some quaint old houses in Bontport Street. Before the silting of the river Barnstaple was a seaport of some importance. It has manufactures of lace, leather, gloves, and pottery, known as "Barum-ware," and there are shipyards, saw mills, and foundries. Barnstaple has existed since the reign of Athelstan, in the tenth century, who built a castle here, but was incorporated in the reign of Henry I. Pop., 1891, 13,000; 1901, 14,137; 1911, 14,485.

BARN SWALLOW. Two distinct species of swallow frequent barns and outbuildings in North America, but that to which the name

properly applies, and should be restricted, is the fork-tailed one which makes its nest inside the building, while the other, square-tailed one, which nestles on the outside of the walls, should be called cliff or eaves swallow. The barn swallow proper, then, is the one named by naturalists *Hirundo* or *Chechdon erythrogastra*, and it is among the most widely familiar birds of the whole continent. It is lustrous blue above, and below is pale reddish-brown, with the forehead, chin, and throat bright chestnut, bounded by a collar-like band of blue across the breast; the tail is deeply forked, and each tail feather, except the central pair, has a white spot on its inner web. These swallows arrive from the south, where they have wintered in the tropics, in May.

Nesting Habits.—Before the country was civilized, these swallows frequented only such parts of it as had rocky exposures, and they made their nests in niches on the face of a cliff, as they yet do in some remote parts of the western mountains. As soon, however, as stables and sheds were erected by white settlers, the swallows took possession, and this increasing and welcome acquaintance with man has continued as civilization pushed west and north, until now a barn-swallow dwelling in aboriginal fashion is a curiosity. The nest is composed of pellets of mud plentifully mixed with straw, and may sit flat upon a frame beam at a safe height, when it is a simple cup; or it may be plastered, in the form of a hollow bracket, against the rafters or higher walls. Invariably, however, the nest of this species is *inside* the barn or shed. It is bedded with soft grass and feathers and contains five rather elongated, buffy-white eggs, spotted about the large end with reddish and purple dots and splashes. These birds are not only perfectly harmless, but they consume a vast number of small insects which are more or less injurious or annoying. It is most unfortunate, therefore, that they seem an object of especial attack by the English sparrows, which not only seize upon many nests for their own breeding purposes, but wantonly tear many others to pieces, destroying eggs and young as if in a spirit of mere malicious mischief. In this way the barn swallows of the more northerly States and eastern Canada have been greatly reduced and in some places exterminated. They depart for the south in flocks earlier in the autumn than do most other migrants. See SWALLOW and Plates of SWALLOWS and of EGGS of SONG BIRDS.

BARNUM, PHINEAS TAYLOR (1810-91). An American showman, born at Bethel, Conn. His father was a tavern keeper, and while attending the village school, Barnum traded with and played practical jokes upon his father's customers. At the age of 13 he was employed in a country store and at 18 went largely into the lottery business. When only 19, he married clandestinely and moved to Danbury, where he edited *The Herald of Freedom* and was imprisoned 60 days for a libel. In 1834 he removed to New York, where, hearing of Joyce Heth, alleged nurse of Washington, he bought her for \$1000, and with the aid of forged documents and puffing exhibited her to considerable profit. Reduced again to poverty, he sold Bibles, exhibited negro dancers, and wrote for newspapers, until he bought the American Museum in New York, which he raised at once to prosperity by exhibiting a Japanese mermaid, made of a fish and a monkey, also a white negress, a woolly

horse, and finally a noted dwarf, styled "General Tom Thumb," whom he exhibited also in Europe in 1844. In 1847 he offered Jenny Lind \$1000 a night for 150 nights. The tickets were sold at auction, a single ticket bringing in one case as much as \$650; and his gross receipts for 95 concerts were over \$700,000. He built a villa at Bridgeport, in imitation of the Brighton Pavilion, and engaged in various speculations, one of which, a clock factory, made him bankrupt. Settling with his creditors in 1857, he engaged anew in his career of audacious enterprises and made another fortune. Two of his museums having been destroyed by fire, in 1865 and 1868, he established in 1871 his "Greatest Show on Earth," a traveling circus and menagerie, with many new features. He was an unsuccessful candidate for Congress in 1866, but was four times elected to the Connecticut Legislature. His *Autobiography* (1854, since greatly enlarged) has at least the merit of frankness. In 1865 he published *The Humbugs of the World*, and in 1869 *Struggles and Triumphs*.

BARNWELL, ROBERT WOODWARD (1801-82). An American statesman. He was born at Beaufort, S. C., graduated at Harvard in 1821, and was admitted to the bar. He was in Congress from 1829 to 1833, and was Senator in 1850-51. After the secession of the Southern States he was sent as a delegate to the famous Montgomery Convention and cast the decisive vote in the election of Jefferson Davis. He was also a member of the Confederate Senate and was twice president of the University of South Carolina.

BAROACH, bà-rôch'. A town in India. See BROACH.

BAROCCHIO, bà-rôk'kè-ò, **BAROZZIO**, or **BAROZZI**, GIACOMO DA VIGNOLA. See VIGNOLA.

BAROCCI, bà-rôt'chè, or **BAROCCIO**, -chò, FEDERICO (1528-1612). An Italian painter of the late Renaissance. He was born at Urbino and received his early training with his father, a sculptor, and from the painter Battista Franco. He then studied the works of Raphael at Rome, but was influenced less by these than by the paintings of Correggio. Upon his return to Urbino he executed many paintings, which survive for the most part in the churches of that city, the most important of these being "St. Sebastian," in the cathedral. Notwithstanding the flattering invitations of the Grand Duke of Tuscany, the Emperor Rudolph and Philip II of Spain, Barocci continued to reside in his native city. On a later visit to Rome he was employed in the decoration of the Belvedere in the Vatican, but during all the rest of his life suffered from the effects of a poison administered at that time by jealous rivals. Among his most important paintings at Rome is the "Burning of Troy," in the Borghese Palace; others are in the Vatican Collections and in the galleries of Florence. His "Christ Crucified," painted for the Doge of Genoa and now in the cathedral, is reputed his finest work. Barocci's importance consists in his opposition to the mannerism of his day, and in his careful drawings, his comparative fidelity to nature, and, above all, his emphasis on color. Consult R. H. Krommes, *Studien zu Federigo Barocci*, with bibliography (Leipzig, 1912).

BAROCCO, bà-rôk'kò, or **BAROQUE**, bà-rôk' (It. *Barocco*, Fr. *Baroque*, Sp. *Barruco*). The origin of the word is uncertain, but in general it means 'irregular, imperfect.' In the fine arts the word applies to the last phase of the classic

revival in Italy and its derivatives elsewhere. The tendency of taste from 1560 on was away from classic refinement and restraint toward ostentation and restlessness, and all the arts underwent a profound change of spirit and expression. Much of the work was showy, meaningless, even vulgar, though redeemed occasionally by brilliancy and power.

In architecture, of the three great contemporaries, Vignola (1507-73), Palladio (1518-80), and Michelangelo (1475-1564), Vignola represents the still dominant classical refinement; Palladio the early symptoms of the new taste in his works at Vicenza; and Michelangelo in his work at St. Peter's, his sculptures of the Medici tombs at Florence, in his Sistine frescoes, and in his eccentric Porta Pia at Rome, displays an impatience of precedent and a striving after novel effects and powerful expression which, carried to an extreme by less masterly successors, became characteristic of architecture until late in the eighteenth century. Of these successors Lorenzo Bernini was the most gifted, both as architect and sculptor. His great colonnades in front of St. Peter's are magnificent, in the finest antique Roman spirit; but his baldachin in the same church is a huge structure of bronze in the best possible taste. Carlo Maderno, or Maderna (1556-1629), in his façade of St. Peter's and F. Borromini (1599-1667) in his church of Sta. Agnese on the Piazza Navona, and both of these in other works, display the Baroque tendency to the extreme. Characteristic of all these works is a predilection for "colossal" orders—pilasters and columns running through two or more stories, with consequent bigness of scale in all the details; for large consoles and brackets, for broken, interrupted, and contorted entablatures and pediments, and for façades whose plans are bent in and out by multiplied curves and angles; in short, for large, even coarse details and agitated and broken lights and shadows and silhouettes. In interiors the use of stucco even for sculpture, of dark-colored marbles and showy inlays of *pietra dura* (q.v.), theatrical tricks of perspective in the decorative painting, and extravagantly attitudinizing sculpture, all exhibit the degenerate taste of the seventeenth century. The Jesuit order contributed to this by the encouragement it gave to sensational design and imitative shams in the many costly churches it erected during this period, so that the style as shown in churches (e.g., Sta. Maria Vittoria at Rome or Gli Scalzi at Venice) is sometimes called the Jesuit style. Both the façade and the interior of St. Peter's show the influence of these tendencies, of which the earlier phase may be recognized in the three fine palaces on the Capitol at Rome begun by Michelangelo but not completed till long after his death. Not all his successors yielded to the Baroque spirit: many works of G. della Porta and D. Fontana show classical dignity and restraint, while such late works as Longhena's palaces and his Church of the Salute at Venice, and Galilei's fine façade of S. Giovanni in Laterano at Rome, are designs of much dignity and artistic worth.

The Baroque fashion spread to Germany and Austria, where its products were for the most part heavy and tasteless, and to France, where under Louis XIV there was much more of classical restraint and cold stateliness than in Italy (e.g., St. Sulpice, Paris, and the Palace of Versailles); and where in the eighteenth cen-

tury it developed the fantastic style of interior detail known as "Rococo" (q.v.), "genre Rocaille," and "Louis Quinze." The only distinctively Baroque monument in England is the fantastic porch of St. Mary's at Oxford. The extravagant Spanish Churrigueresque style (q.v.) is the Iberian version of the Baroque, and its influence is traceable in Latin America in church façades and altarpieces. See articles on architects named. Consult also the various histories of architecture; also Gurlitt, *Geschichte des Barockstiles in Italien* (Stuttgart, 1887); Ricci, *Baroque Architecture and Sculpture in Italy* (London, 1912).

BAROCHE, bâ'rôsh', PIERRE JULES (1802-70). A French politician, born in Paris; became an advocate in 1823 and in 1847 was sent to the Chamber of Deputies from Rochefort. After the Revolution of 1848 he was elected to the National Assembly. He voted at first with the adherents of the Republic, but later favored the policies of Louis Napoleon. In March, 1850, he succeeded Ferdinand Barrot as Minister of the Interior. In April, 1851, he was appointed Minister of Foreign Affairs. He became Minister of Justice and Public Worship in 1863, a senator in 1864, and resigned his portfolios in 1869. Upon the downfall of the Second Empire Baroche fled to Jersey, where he died.

BARODA. A fortified city of Gujarat, India, capital of a district, and of the native state of the same name. It is 248 miles north of Bombay, with which it is connected by railway (Map: India, B 4). It stands on the Vishvometri, which is here crossed by four stone bridges, one of singular construction—an upper range of arches resting on a lower one. Baroda, because of its importance as a railroad centre between the coast and the interior, has considerable trade in the produce of the surrounding districts, grain, flax, cotton, and tobacco. The city is intersected by two wide streets, which meet at right angles in a central market place. The chief native structures of interest are the old palace, the Naulakhi Well, and the modern Lakshmi Villas palace, which dominates the town. There are several fine European buildings, including the Anglican Church, dating from 1824, the Baroda College, the Anglo-Vernacular School, the Baroda State Library, and the Dufferin Hospital. The town has a splendid modern system of water works since 1892, supplied from a distance of 18 miles by the artificial lake covering 4.71 square miles. Baroda is the residence of the Gaikwar, a protected Mahratta prince. In 1875 Sayaji Rao III replaced Malhar Rao, the preceding ruler, who was accused of misrule and oppression and suspected of an attempt to poison the British resident. The state has been tributary to Great Britain since 1802. Pop. of town, 1891, 116,400; 1901, 103,800; 1911, 99,345. These figures include a military cantonment of 5000 troops. Area of state, 8100 square miles. Pop., 1891, 2,415,400; 1901, 1,952,692; 1911, 2,032,798.

BAROGRAPH. See ANEROID.

BAROMETER (Gk. βάρος, *baros*, weight + μέτρον, *metron*, measure). An instrument for measuring the elastic pressure of the atmosphere. Plato and Aristotle maintained that the atmosphere has weight; Galileo and Torricelli knew that pressing upon the water in a well forced a portion of it to rise up the bore of a pump as fast as the piston rose. The fact that water could not be made to rise more than 33 feet in this manner showed to Galileo's mind the limit-

ing pressure of the atmosphere, viz., about 15 pounds to the square inch. In 1643 his pupil and successor, Torricelli, desiring to find a convenient method of measuring the variations of atmospheric pressure, asked Viviani to use a short glass tube closed at one end, filled with mercury, and inverted in a basin of that heavy liquid, as in Fig. 1. As he predicted, so it was found that a column of mercury 30 inches high, corresponding to the atmospheric pressure (15 pounds to the square inch), was held up by the air pressure, and the upper portion of the glass tube was empty. This vacant space was called

Among the important forms of the mercurial barometer may be mentioned the siphon barometer illustrated in Fig. 3. If the diameter of the tube is perfectly uniform, the capillary effects at the upper and lower ends of the column partially neutralize each other, but not entirely so, because the mercury in the lower end is exposed to the air, and its capillary reaction differs from that of the mercury in the vacuum. Moreover, the superficial film exposed to the air changes by oxidation, and its surface tension is altered with lapse of time. The measurement of the barometric column is facilitated by having

FIG. 3. — Siphon barometer.

FIG. 4. — Fortin barometer.

FIG. 5. — Section of cistern of standard barometer. (Green pattern.)

the Torricellian Vacuum. According to Hellmann, this simple apparatus was first called a barometer by Boyle.

With the modifications and auxiliary apparatus necessary to secure the accuracy in measurement demanded by modern science, the mercurial barometer is now considered the standard instrument for measuring the elastic pressure of gases. In the normal barometers constructed for the International Bureau of Weights and Measures at Paris provision is made for measuring the temperature of the top and bottom of the mercurial column, the temperature of the metallic measuring scale, the imperfection of the vacuum, if any, the capillary effect at the surface of the mercury in the basin and in the tube, the verticality of the measuring scale, the errors of pointing and reading, the exact density of the mercury, and every other source of error that has been suggested.

the upper and lower arms of the siphon in the same vertical line, as shown in the illustration. In some barometers the mercury of the open end is protected from the air and dust by a convenient flexible covering, such as a film of oil, or by tying a loose india-rubber bag over the open end of the tube. When the barometric tube is of large bore, for example an inch or more, the capillary depression of the column at the centre is inconsequential.

The standard form of portable barometer is that illustrated in Fig. 4, as first constructed by Fortin, and now very generally copied by makers throughout the world. In this form the measuring scale extends from an ivory point (*p* in Fig. 5) upward, usually as a part of a brass cylinder inclosing and protecting the whole tube. By means of the screw *S* the mercury in the cistern may be raised or lowered until its surface just touches the point *p*. The observer

sights across the upper end of the column of mercury, and the corresponding reading on the scale is the height of the mercurial column above the point *p*. When this barometer is to be carried about, the screw *S* is turned until the mercury completely fills the cistern and is pushed up to the very top of the glass tube. The barometer is then inverted and carried or kept bottom up until wanted. In order to prevent the accidental rise of small bubbles of air within the tube of the barometer, Bunsen invented a so-called air trap, which consists simply of forming a slender internal constriction within the tube near the lower end. This slender point projects downward, and its narrow end opens within the mercury occupying the slightly enlarged portion of the main tube below the trap. Any bubbles of air slipping up the tube are almost certain to be caught in this trap and will escape back into the open air when the barometer is turned upside down for transportation. The most accurate barometers and the newest patterns are now made by Fuess, of Berlin, Green, of New York, and Casella, or Negretti & Zambra, of London. The normal barometers of Paris, Berlin, and St. Petersburg are read by means of reading microscopes so adjusted that a direct and a reflected image of a scale division or a pair of suitable cross wires appear in the field of view. By optical principles the mercury surface causing the reflection lies midway between the two images, and its position may thereby be accurately ascertained. The ordinary barometers of laboratories and meteorological stations are read by means of a vernier (q.v.) sliding up and down the scale, and by sighting across the edge of the vernier plate to the top of the mercurial column.

Liquids of small density as water, glycerine, and the like may be used to secure barometric effects upon a greatly enlarged scale. Methods of optical or mechanical magnification may also be employed, but while relative changes of air pressure may be obtained thereby, the absolute pressure cannot generally be determined accurately by such means.

Barometric pressures are properly expressed only in standard units of force or dynes, but it is more common to express them in inches or millimeters, meaning thereby the force or pressure corresponding to weight of a mercurial column of that height; but this pressure depends, not merely upon the height of the column of mercury, but also upon its density and on the force of gravity. The former varies with the temperature; the latter varies with latitude and slightly with the height above sea level. Moreover, the surface tension or so-called capillarity of the mercury in the glass tube and the cistern affect the height of the column of mercury. Corrections for these sources of error must therefore be made, and, by vote of the International Congress, meteorologists now follow the example of the physicists in reducing all barometric measurements to the standard density of pure mercury at zero degrees, Centigrade, and to standard gravity at the latitude of 45° and sea level. A standard pressure of 750.06 mm. (29.53 inches), corresponds to a force of 1,000,000 dynes. The suggestion of Bjerknes Sandström and others that this force be named one Bar and adopted as a new unit of pressure is generally accepted and is already in some use, notably by the United States Weather Bureau in its Weather Map of the Northern Hemisphere, and

by the British Meteorological Office. The subdivisions of the new unit are, decibar, centibar, and millibar. The latter is $\frac{1}{1000}$ of a millimeter on the ordinary scale. The barometer has many important uses and applications in science and is constantly employed in hypsometry, or the measurement of heights, meteorology, and investigations in physics. (See METEOROLOGY; HYP-SOMETRY.) The mercurial barometer was made to register its own indications by Samuel Moreland as early as 1670 or 1680, and many improved forms have since been devised, registering by the help of photography, electrically, mechanically, or by gravity. The best of these appears to be the sliding-weight barograph, as perfected by Sprung in Germany, and a mechanical siphon barograph of great precision by Marvin in the United States. When the branches of a siphon tube are properly proportioned, the level of the mercury in the open arm is unaffected by changes of temperature. This automatic compensation is realized in the Marvin barograph. As a substitute for the mercurial barometer, a form called the aneroid (q.v.) was devised by Vidi, and a similar form, sometimes called the pressure gauge (see MANOMETER), was devised by Bourdon.

Bibliography. For many details as to the history and construction of the instrument and corrections for sources of error, consult Abbe, *Treatise on Meteorological Apparatus and Methods* (Washington, 1887). For an interesting account of the invention and development of the barometer, with illustrations showing early instruments, consult Gerland and Traumüller, *Geschichte der physikalischen Experimentirkunst* (Leipzig, 1899). The ordinary student manuals of practical physics contain descriptions of barometers and their use, while further information can be obtained from the circulars and bulletins of the United States Weather Bureau.

BAROMETER, WATER. A barometer in which water is used instead of a column of mercury. As water has about one-fourteenth of the specific gravity of mercury, the pressure of the atmosphere will support a column nearly 14 times as high, consequently the movement caused by variations in atmospheric pressure will be over a more extended scale. The chief disadvantage of this arrangement is due to the water vapor in the upper part of the tube exerting a pressure on the liquid below and causing a shortening of the column. The tension of the aqueous vapor depends upon the temperature, and changes in the reading may be produced independent of variations in the atmospheric pressure. Glycerine and sulphuric acid have also been used in similar barometers with much smaller errors.

BAROMETRIC LIGHT. A faint electric light produced in the vacuum of a mercurial barometer by swinging the instrument to and fro, causing friction of the mercury against the inside of the tube. The phenomenon was first noticed by Jean Picard of Paris in 1675, and an instrument to produce this light was devised by John Bernoulli for Frederick I of Prussia in 1700. Using an air pump to produce a vacuum, Francis Hauksbee constructed a jar in which a bright light was obtained by the friction of falling mercury with the glass. A description of the apparatus and his explanation of the phenomenon are given in the *Philosophical Transactions* of the Royal Society of London for

1705 and 1706. Consult also Tyndall, *Lessons in Electricity* (London, 1876).

BARON, bār'on (ML. *baro*, from Kelt. *bar*, man, or AS. *beorn*, OHG. *baro*, man, vassal. The notion of nobility later attached to *baron* came through the intermediate stage: the man of a lord). The title applied to the lowest degree of the English hereditary nobility. The rank of baron forms a species of landing place, corresponding amongst noblemen, in a certain sense, to that of a gentleman at a lower stage of the social pyramid. It was in this sense that the word was used in former times to include the whole nobility of England, because all noblemen were barons, whatever might be the higher grades in the peerage which they occupied. The word "peer" has recently come to be used with the same signification, perhaps because it is no longer necessarily the case that every nobleman must be a baron, there being instances in which earldoms and other honors have been given without a barony being attached to them, and in which the barony has been separated from the higher degree by following a different order of descent. The general theory of the Constitution, however, still is, that it is as barons that all the peers sit in the Upper House; and it is on this ground that the archbishops and bishops are said to sit in virtue of their baronies. The distinction into *greater* and *lesser* barons was commonly used in the twelfth and thirteenth centuries. At first the *greater barons* were those whose estates were considerable enough to be taxed as a *barony* in the Exchequer, who led their own vassals in war, and who received individual summonses from the King to attend his councils and military gatherings; all other tenants in chief were the *lesser barons*, whose summonses and payments were only general. Later, as the royal councils developed into Parliament, and this body became more influential, the King called to it from the baronage only the greater barons, and indeed only a select group of them. Thus the *lesser barons* ceased to be called barons at all, and the term was gradually restricted to those who were regularly summoned to Parliament. The custom of conferring the rank of baron by letters patent, by which it was converted into a mere title of honor apart from the possession of landed property or of territorial jurisdiction, was first introduced by King Richard II, who in 1387 created John de Beauchamp, of Holt Castle, Baron of Kidderminster. In Germany the old barons of the empire, or *Freiherren*, were for the most part raised to the dignity of *Grafen* (counts) and princes; while the lesser, in place of passing into the ranks of the untitled gentry, as in England, constituted a grade of the lower nobility, to which no duties were assigned and scarcely any political privileges belonged.

When a baron is first summoned to the British House of Lords, a letter in the Sovereign's name directs him to repair to the Parliament to be holden at a special time and place, to advise with the Sovereign, the prelates, and nobles about the weighty affairs of the nation. On the arrival of the new peer he is presented by two barons to the Lord Chancellor, his patent or writ being carried by a king-at-arms. This is read by the Chancellor, who congratulates him on becoming a member of the House of Peers and invests him with his robe. The oaths are then administered by the clerk of Parliament, and the new baron is conducted to a seat on the barons' bench. Be-

tween creation by writ and by patent there is this distinction, that in the case of the former it is necessary for a man actually to take his seat in the House of Lords before the title may vest. On account of the difficulties attending this mode of procedure, creation by writ is practically obsolete. But though creation by patent is in general the surest way of insuring the hereditary character of the peerage, it labors under one disadvantage as compared with a creation by writ, viz., that whereas in the latter case the dignity once assured by possession passes to the heirs of the holder without any words to that purpose, in the former there must be words to direct the inheritance, else the dignity endures to the grantee only for life. Where the patent, again, in place of being silent as to the succession, expressly sets forth that the dignity of baron is for life merely, it was held, in the Wensleydale Case, that it does not make the grantee a lord of Parliament at all.

The coronation and parliamentary robes of a baron differ very slightly from those of an earl. The right of wearing a coronet was conferred on barons for the first time by King Charles II, their headdress till then having consisted of a cap of crimson velvet, lined with ermine, and having a plain gold band. A baron's coronet as now worn is adorned with six pearls, set at equal intervals on the chaplet. Coronets are worn only on great occasions of state ceremonies. A baron has the title of "right honorable lord," etc., and is addressed as "my lord" or "your lordship." His wife has also the title of "right honorable," and is addressed as "madam" or "your ladyship." The barons of the Exchequer (q.v.) and of the Cinque Ports (q.v.) are examples still existing of the ancient barons by office.

Consult: *Cyclopædia of Political Knowledge* (London, 1853); Stubbs, *Constitutional History of England*, vol. ii (Oxford, 1891); Pike, *Constitutional History of the House of Lords* (London, 1894); Badeau, *Aristocracy in England* (New York, 1886). See **PEER**.

BARON, bā-rōn', JULIUS (1834-98). A German jurist, born at Festenberg, Silesia. He studied at Breslau and Berlin and was appointed professor in 1880 at Greifswald, in 1883 at Bern, and in 1888 at Bonn. His works include *De Judiciorum Constitutione in Veteris Saxonie Urbibus* (1855); *Die Gesamtrechtsverhältnisse im römischen Recht* (1864); *Abhandlungen aus dem römischen Civilprozess* (3 vols., 1881-87); *Die Borsenenquete* (Berlin, 1894); *Pandekten* (1872; 9th ed., 1896).

BARON, bā-rōn', or **BOYRON**, bwā'rōn', MICHEL (1653-1729). A celebrated French actor and playwright, a pupil and friend of Molière. Endowed with great beauty and an unusually fine voice, he soon became the favorite of the Paris public, excelling both in tragedy and in comedy, but he was inordinately vain of his personal appearance and was frequently connected with the scandals of the time. He retired from the stage in 1691 and on his reappearance in 1720 had lost none of the great charm and power of his talents. He was stricken with apoplexy while on the stage and died soon afterward. He wrote several comedies, of which *L'Homme à bonne fortune* (1686) held the stage for more than a century. Some of his other plays are *Le rendez-vous des Tuileries* (1685); *Les enlèvements* (1685); *La coquette ou la fausse prude* (1686); *Le jaloux* (1687).

BAR'ON AND FEME, fēm or fām (Fr. *femme*, woman, wife, from Lat. *femina*, woman). Norman-French words employed at the common law to denominate husband and wife (q.v.). They are rarely used in the United States.

BARON AND FEME. In heraldry, the expression used to designate the bearing by which the arms of husband and wife are carried per pale, or marshaled side by side on the same shield. The husband's arms are always carried on the dexter side. Where the wife is an heiress—i.e., the representative of her father's house—her husband carries her arms, not per pale, but in a shield of pretense; and they are quartered with the paternal coat by the issue of the marriage. See **HERALDRY**.

BAR'ONET (Fr. dimin. of *baron*). The lowest degree of hereditary honor in Great Britain. The name "baronet" or "bannaret" was originally applied to the lesser barons of the kingdom, but passed out of use with time. The order of baronets was created in 1611 by King James I, for the ostensible object of promoting the plantation of Ulster, in Ireland; but in reality for the purpose of refilling his depleted exchequer. The sum exacted, with the fees of honor due to the officers, amounted to upward of £1000 on each patent. Every person, however, who sought the dignity of a baronet was compelled to give proof that he was a gentleman of blood and had an annual income of more than £1000. It was part of the bargain that no title should be created between a baronet and a baron, and that the number of the former should be permitted to diminish as the families of the original 200 died out. The latter stipulation was very speedily departed from. Irish baronets were created until 1800, since which period all baronetcies are of the United Kingdom. There is no limit to the creation of baronets but the will of the sovereign. At investiture there is no ceremony. The rank is communicated by patent or writ. According to the patent the rank may be confined to direct heirs-male; or extended to heirs-male collateral, and sometimes, in default of direct male heirs, to the husbands of heirs-female. The rank of baronet does not raise a person above the rank of commoner. Baronets of Scotland and Nova Scotia were instituted in 1625 by Charles I for the purpose of encouraging the settlement of Nova Scotia. There are no new additions to this branch of the baronetage, the latest creation having been in 1707, the year of the union of Scotland and England. Though created for a mercenary object, the order of baronet has always constituted a conservative force in the political and social life of Great Britain, as it consists of men of wealth and influence. Consult: *The Baronetage under Twenty-seven Sovereigns, 1309-1910*; *A Dated Catalogue of Events* (London, 1911).

BARONIUS, CÆSAR (1538-1607). An eminent Roman Catholic ecclesiastical historian. He was born at Sora in the old kingdom of Naples, Oct. 30, 1538, and educated at Naples and Rome. He was one of the first pupils of St. Philip Neri, who founded the Congregation of the Oratory, of which Baronius became superior in 1593. Baronius soon after became father confessor to the Pope, apostolical prothonotary (1595), cardinal (1596), and librarian of the Vatican Library (1597). On the death of Clement VIII in 1605, and on that of Leo XI, his successor, he was, against his will, a candidate for the papacy. Having already evinced his

great diligence and learning as a church historian, he was commissioned by Philip Neri, while still a young man, to prepare the Roman Catholic counterpart to the Protestant "Magdeburg Centuries" (q.v.). Baronius entered upon this commission with great energy and in a position most favorable for access to authorities, composing his *Annales Ecclesiastici a Christo nato ad annum* 1198 (12 vols., Rome, 1588-1607), in which work he labored till his death, June 30, 1607. His polemical purpose affects his use of material, but still the material itself is so enormous and often so recondite that his work is a storehouse of learning of permanent value. He made many mistakes of all kinds, of course, especially in chronology. These were to a considerable extent corrected by A. F. Pagi. O. Raynaldus and others prepared a continuation of the *Annales* down to 1646. The best edition of the *Annales* is that by A. Theiner (37 vols., Bar-le-Duc and Paris, 1864-83), but as it is not complete, the one best to use is that by Mansi (Lucca, 1738-57). Both editions contain Pagi's corrections and the continuation, although the latter is of inferior value.

Consult: Rauschen, *Jahrbücher der christlichen Kirche unter dem Kaiser Theodosius dem Grossen: Versuch einer Erneuerung der Annales Ecclesiastici des Baronius für die Jahre 378-95* (Freiburg im Br., 1897); Baronius' *Martyrologium Romanum* (1586) is also worthy of separate mention. There is a life of Baronius by Hieronymus Barnabeus (Rome, 1651; 2d ed., Vienna, 1718), and one by Kerr (London, 1898).

BARON MUNCHAUSEN, mün-chä'sen. See **MÜNCHHAUSEN**.

BARONS OF THE EXCHEQUER. The honorary title of the judges of the Court of Exchequer in England. Originally the revenue board of the crown, attended by the great men of the realm, the Court of Exchequer, in the course of time, became one of the three ordinary tribunals, sharing with the King's Bench and the Common Pleas the common-law jurisdiction of the kingdom. It consisted of six judges, a chief baron and five *puisne* barons. Its judges, whether peers of the realm or not, continued to be distinguished by the title of baron until 1875, when the Court of Exchequer was merged in the High Court of Judicature. See **COURTS**.

BARONS' WAR. See **MONTFORT**, **SIMON DE**.

BAR'ONY (OF. *baronie*). A term of somewhat indefinite signification in the feudal system of land tenure. We know that it was compounded of many knight's fees held directly of the king by a single title, and that it was therefore usually of great extent; and we know also that the holder, or "tenant," of a barony was a baron, a peer of the realm, and entitled to a seat in the Parliament. But whether all manors (see **MANOR**) were capable of being held as baronies, or only great manors, or whether the term was limited to an estate made up of several manors, commonly known as an "honor" (q.v.), we do not know. It is certain that every lord of a manor who was entitled to hold a court-baron (q.v.) was not a baron in the strict sense of the term, any more than he was a lord in the strict sense of that term. But a barony, however constituted, always involved the idea of a general jurisdiction to be exercised through courts maintained by the lord of the estate. It was decided in 1660 that baronies by tenure were extinct in England and could not be revived, and this decision was reaffirmed by the House of

Lords in the celebrated Berkeley Peerage case in 1863. Consult Pollock and Maitland, *History of English Law* (2d ed., Cambridge, Eng., and Boston, 1899). In Scotland any large freehold estate, even when held by a commoner, is known as a barony.

The term *barony* is also applied to the hereditary title or degree of nobility which in England entitles the holder to a seat in the House of Lords. See *BARON*.

BAROQUE. See *BAROCCO*.

BAROTAC NUEVO, bā'rō-tāk' nwā'vō. A pueblo in the southeast part of the island of Panay, in the province of Iloilo, Philippines. It is on the left bank of the Jalaur River, 14 miles north-northeast of the town of Iloilo. It is in a fertile region and trades in trepang and rice. Pop., 1903, 9904. The town of Dumangas, on the right bank of the river, was annexed to Barotac Nuevo in 1903. Its population at that time was about 15,000.

BAROTSE, bā-rōt'sē. A former kingdom of South Africa, now a part of Rhodesia (q.v.).

BAROZZI, bā-rōt'sē, GIACOMO. See *VIGNOLA*.

BARQUISIMETO, bār-kē'sē-mā'tō. An episcopal city, capital of the State of Lara, Venezuela, on the Barquisimeto River, 90 miles southwest of Puerto Cabello (Map: Venezuela, D 2). The city is in a plain, 2000 feet above sea level. It is the seat of a college and other educational institutions and has several fine buildings, among which are the government palace, the barracks, the cathedral, and the market. It is the centre of a fertile agricultural and stock-raising district and, owing to its excellent transportation facilities, controls important commercial interests. The principal articles of trade are coffee, cacao, sugar, and rum. Barquisimeto, one of the oldest settlements made by the Spaniards in America, was founded in 1552. It was almost completely destroyed by the great earthquake of 1812 and suffered severely during the War of Independence and the later civil wars. From 1830 to 1881 it was the capital of the state of the same name. Pop., 1891, about 30,000 (with the district); 1894, 31,476; 1910 (est.), 32,500.

BARR, AMELIA EDITH (HUDDLESTON) (1831-). An Anglo-American novelist. She was born at Ulverston, England, March 29, 1831, and married Robert Barr in 1850. In 1854 she removed to Texas and in 1869 to New York, where she took up literature as a calling. She has written some 30 novels, among them *Romance and Reality* (1872); *Jan Vedder's Wife* (1885); *A Daughter of Fife* (1886); *A Bow of Orange Ribbon* (1886); *Friend Olivia* (1891); *Birds of a Feather* (1893); *The Lone House* (1894); *Bernicia* (1895); *A Knight of the Nets* (1896); *Trinity Bells* (1899); *The Maid of Maiden Lane* (1900); *Souls of Passage* (1901); *The Lion's Whelp* (1901); *The Black Shilling*, *The Belle of Bowling Green* (1908); *The Strawberry Handkerchief* (1908); *The Hands of Compulsion* (1909); *The House of Cherry Street* (1909); *Sheila Vedder* (1911). A full list of her books would comprise more than 60 titles. She is best in historical tales with a flavor of religious persecution, and in scenes of Scotland, the north of England, and Dutch New York. Consult her autobiography, *All the Days of my Life* (1913).

BARR, ROBERT (1850-1912). An English novelist, born at Glasgow, Scotland. He was educated at the Normal School of Toronto, Canada, was headmaster of the Central School,

Windsor, Ontario, and in 1876 became a member of the staff of the *Detroit Free Press*, in which his contributions appeared under the signature "Luke Sharp." He was from time to time a resident of the United States and drew freely upon American life for his scenes and characters. In 1881 he removed to London, to establish there the weekly English edition of the *Free Press*, and in 1892 joined Jerome K. Jerome in founding the *Idler* magazine, from whose co-editorship he retired in 1895. Barr displays much shrewd observation in *A Woman Intervenes* (1896), a story of love, finance, and American journalism. He essayed the historical novel in the *Countess Tekla* (1899). In *The Midst of Alarms* (1894, 1900, 1912), a story of the attempted Fenian invasion of Canada in 1866, has enjoyed wide popularity. Other publications are: *In a Steamer Chair* (1892); *The Face and the Mask* (1894); *The Unchanging East*, travels (1900); *The Victors* (1901); *A Prince of Good Fellows* (1902); *The Tempestuous Petticoat* (1905-12); *Stranleigh's Millions* (1909); *The Sword Maker* (1910); *The Palace of Logs* (1912); *The O'Ruddy*, with Stephen Crane (posthumous, 1913).

BARRA. A small island of the outer Hebrides, Inverness-shire, Scotland (Map: Scotland, A 3). It is 8 miles long and 2 to 4 miles broad, with deep inlets of the sea. The inhabitants (about 2500) are Roman Catholics and speak Gaelic. Their main occupations are cattle raising and fishing. South of Barra is the islet of Berneray, with the highest lighthouse in Great Britain, 683 feet above high water and visible for 33 miles.

BARRACKPUR, bār'rak-poor' (Eng. *barrack* + Skt. *pur*, city). A native town and military cantonment in Bengal, British India, on the east bank of the Hughli, 15 miles north of Calcutta and on the East Bengal Railway (Map: India, E 4). It is the capital of a sub-district which was formed in 1904. Many inhabitants are employed in the mills, which are just outside the town. Pop., 18,000. From the salubrity of its air Barrackpur is a favorite retreat for Europeans from Calcutta and is the country residence of the Governor-General. Barrackpur is historically prominent among the centres of the mutinies of 1824 and 1857. See *INDIA*.

BARRACKS (Fr. *baraque*, It. *baracca*, Sp. *barraca*, a tent; origin uncertain). A permanent structure for the housing of troops, as distinguished from temporary cantonments or camps. In England the practice of billeting or quartering soldiers on the citizens had in 1792 become a great burden; added to which was the effect on the morals of the community, caused by the dissolute character of the soldiery of the period. Consequently George III obtained the consent of Parliament for the construction of new barracks, not without considerable opposition, however; as it was urged that the liberty of the subjects might possibly be endangered by separating the soldiers from the citizens and placing them in the hands of the ruling power. At first, barracks were built without much regard to the health of the troops, the only consideration apparently being their local usefulness. In the United States great care is taken in the selection of site and in the building of military barracks or forts. Good elevation, water, and clean environment are of the first importance; after which, in the design and construction, an abundant supply of fresh air is

made an important factor. The name is used as a part of the official designation of a number of important military posts in the United States, the best known of which are: Columbus Barracks, Jackson Barracks, Jefferson Barracks, Madison Barracks, Plattsburg Barracks, San Diego Barracks, and Washington Barracks (q.v.).

BARRACUDA, bār'rá-kōō'dá, or **BARRACOOTA** (native name). 1. A large, pike-shaped, predatory, marine fish of the teleost family Sphyrenidae (allied to the mullets), occurring in all tropical and sub-tropical seas and common on both coasts of America. It is known as the Barracoota, or giant Australian mullet, off the Australian coast. The great barracuda or picuda (*Sphyræna barracuda*) frequents our southern coasts. "It sometimes," says Dr. Theodore Gill, "attains a length of 8 feet and a weight of about 40 pounds. . . . It is a carnivorous fish, and destructive to the finny tribes generally. As a food fish it is under suspicion. . . . It seems, however, only under special conditions that the flesh is poisonous, for generally it can be eaten with impunity and is quite savory." This fish is really a source of danger to swimmers, and many mutilations or deaths credited to sharks are probably the result of a barracuda's attack. See Plate of MULLET.

The barracuda of the southern California coast (*Sphyræna argentea*) is 3 feet long, and an important food fish, caught in summer and especially esteemed when dried and salted. The species seen in the North Atlantic, the becuna, spet or sennet (*Sphyræna spet*), is smaller.

2. The snook (q.v.) of the Cape of Good Hope.

BARRA DO RIO NEGRO, bār'rá dô rê'ô ná'grô. See MANÁOS.

BARRAMUNDA, bār'rá-mūn'dá (native Australian name). An extraordinary lungfish (*Ceratodus* or *Neoceratodus fosteri*) of the rivers of Queensland, Australia, where it is sometimes called native salmon, on account of the reddish hue of its flesh, and also flathead. It is an ugly, dark-colored creature, 3 to 6 feet long, looking more like a huge salamander than a fish, though clothed with large scales. It frequents muddy ponds and streams, and when the water is too foul to yield a sufficient supply of oxygen to its gills, the fish comes to the surface or crawls out upon the muddy shore, and at this time the lungs begin to function, and respiration takes place by this means alone. It feeds on fallen leaves and decayed vegetation and it produces eggs in a gelatinous envelope like those of amphibians. Its flesh is highly prized by the aborigines. The principal interest of it lies in the fact that its two species represent a family, Ceratodontidae, constituting an order, Monopneumona, of dipnoans. Fossil remains show that in the early ages the family was distributed nearly all over the world, but now it is restricted to Queensland. It is a survival of the Paleozoic Age. The name is given also to the *Osteoglossum leichhardtii* and many other varieties of river fish. See DIPNOI.

BARRANDE, bá'ränd', JOACHIM (1799-1883). An eminent French geologist and paleontologist, born at Saugues, department of Haute-Loire. He made a study of the Silurian formations in Bohemia, on which he wrote his principal work, *Système silurien du centre de la Bohême* (1852), and his investigations brought out new and valuable information concerning the trilobites. His works include: *Colonie dans le*

bassin silurien de la Bohême (1860); *Représentation de colonies de la Bohême dans le bassin silurien du nordouest de la France* (1853); *Céphalopodes, études générales*.

BARRANQUILLA, bār'rán-kē'lyá. A seaport of Colombia, situated just above the delta of the Magdalena River (Map: Colombia, C 1). The town is not very well built, but is the terminus of river traffic, as the Magdalena is not navigable at its mouth. Barranquilla is connected with the coast by a railroad to the port of Sabanilla, 14 miles to the northwest, and is the seat of a United States consulate. River trade has brought prosperity to the town. It exports coffee and hides, principally to European countries. In 1909, during a revolt, the port was blockaded by the government. Pop., 1912, 48,907.

BARRANQUITAS, bār'rán-kē'tás. A village on the north coast of Porto Rico, 4 miles northwest of Aibonito (Map: Porto Rico, D 3). It has several schools and a church and is in a rich agricultural district. Pop., 1910, town, 772; municipality, 10,503.

BARRAS, bá'rás', PAUL FRANÇOIS JEAN NICOLAS, COUNT DE (1755-1829). A distinguished character of the French Revolution. He was born in Provence and in his youth served as a lieutenant against the British in India. He eagerly joined the Revolutionary party, but was not, as is generally but erroneously stated, a member of the States-General in 1789. He was actively concerned in the storming of the Bastille and the Tuileries, and was appointed administrator of the department of Var and afterward of the county of Nice. In the Convention he voted for the execution of the King, without delay or appeal, and on May 31, 1793, declared against the Girondists. The siege of Toulon, and the triumph of the Revolutionary party in the south of France, were in a great measure owing to his activity and energy; and after the victory he was deeply concerned in all the bloody measures that were adopted. Yet he was hated by Robespierre and the Terrorists as one of the less-decided Revolutionists; and their overthrow was accomplished mainly by him, the Convention appointing him commander in chief and virtually investing him with a dictatorship for the time. While holding this high office, in which he acted with great decision and vigor, and on the same day on which Robespierre fell (9 Thermidor, July 27, 1794), he paid a visit to the Temple and provided for the better treatment of the King's son. He hastened also to the Palais de Justice and suspended the order for the execution of a large number of persons who had been condemned to death. On subsequent occasions, as president of the Convention, he acted with decision both against the intrigues of the Royalists and the excesses of the Jacobins; and on 13th Vendémiaire (Oct. 5, 1795), being again appointed commander in chief by the Convention, he called his young friend Bonaparte to his aid and crushed the sections with merciless discharges of artillery. The Directory being appointed in November, 1795, Barras was nominated one of the five members, and in this capacity he procured the nomination of Bonaparte as commander-in-chief of the army in Italy. It was he who arranged the marriage of Bonaparte with the widow Beauharnais after 18th Fructidor (see FRUCTIDOR: FRANCE), Sept. 4, 1797, when the Royalist intrigues were crushed by Napoleon, the authority of Barras became prepon-

derant in the Directory, and he affected the pomp of a king, and began to give splendid entertainments in the palace of the Luxembourg. This continued for about two years, till the decline of the power of the Directory. After the 30th Prairial (June 18, 1799) Sieyès and he had the whole executive power in their hands; and while Barras secretly negotiated, it is said, with the Bourbon princes, demanding a large reward for their restoration, Sieyès, in secret understanding with Bonaparte, brought about the Revolution of 18th Brumaire (Nov. 9, 1799), which replaced the Directory by the Consulate. Notwithstanding the favors he had formerly conferred on Bonaparte, he was now, perhaps unavoidably, an object of suspicion to him; was compelled to remove from the neighborhood of Paris; resided in Brussels, then in Marseilles; was banished to Rome, and then sent to Montpellier, being kept under constant surveillance of the police and actually found to have been engaged in conspiracies for the restoration of the Bourbons. After the Restoration he returned to Paris and purchased an estate in the neighborhood, where he died. After remaining inaccessible for nearly 70 years, his memoirs were published in Paris and New York, 1895-96. They are of the first importance in throwing light on the history of the Revolution.

BARRATRY (Fr. *barateria*, LL. *barataria*; cf. Eng. *barter*, OF. *barater*, *bareter*, to deceive, cheat, barter). At the common law, the offense of frequently stirring up groundless suits and quarrels. Common barratry is rated as a public nuisance and is punishable, generally, as a misdemeanor. It is not a crime for a man to bring frequent lawsuits without success unless they are vexatious and without reasonable cause. Nor does the institution or instigation of a single groundless and malicious suit make the wrongdoer a common barrator, although his act may amount to the offense of champerty (q.v.) or maintenance (q.v.) and may render him liable to a civil action for damages. In order to convict him of barratry, proof must be given that he has excited groundless litigation in at least three instances. If the offender is an attorney, he may be disbarred as well as punished criminally. Consult Pollock and Maitland, *History of English Law* (2d ed., Cambridge, Eng., and Boston, 1899).

Barratry. In maritime law barratry is any wrongful act willfully committed by the master or crew of a vessel with intent to defraud the owner or charterer; every palpable violation by him or them of trust to the prejudice of the ship and cargo. Negligence does not amount to barratry, unless it is so gross as to constitute fraud. Barratry may be insured against. In *bills of lading* it is excepted frequently from the shipowner's liability. In the absence of such exception the shipowner is liable for the barratry of his agents and servants to the cargo owner. A willful breach of blockade, or sailing out of port without paying port dues, whereby the ship and cargo become liable to forfeiture, is barratrous. Consult Arnould, *Treatise on the Law of Marine Insurance and Average* (7th ed., London, 1901).

BARRATT, JOHN OGLETHORPE WAKELIN. An English pathologist, born in Birmingham. His education was obtained from University College, London, and the universities of Göttingen and Munich. In 1873-76 he was engaged in experimental work in physiology and pathology

at University College, and in 1897-99 was research worker in neuropathology at the London County Asylums laboratory. After serving as pathologist and research student at several other important institutions, he became in 1906 research worker in the department of cytology and cancer research at the University of Liverpool. Of this institution's cancer research laboratory he was appointed director in 1909. He contributed many articles on pathological subjects to German and English medical journals.

BARRE, bâr'rê. A town in Worcester Co., Mass., 22 miles northwest of Worcester, on the Boston and Maine, and the New York Central railroads (Map: Massachusetts, C 3). It is the seat of the Elm Hill School for the feeble-minded, the Stetson Home for poor boys, and has a library and museum. The industries include a cotton, two wool, and a sash and blinds factory, and novelty works. Organized about 1775, the town was named after Colonel Barre, who defended the American Colonies in the British Parliament. The water works are owned by the municipality. Pop., 1890, 2239; 1900, 2059; 1910, 2957.

BARRE. A city in Washington Co., Vt., 6 miles southeast of Montpelier, on the Montpelier and Wells River, and the Vermont Central railroads (Map: Vermont, D 4). It is widely noted for its large granite interests and contains the Aldrich Public Library, Goddard Seminary, Burns Monument, and Spaulding High School. Barre was settled about 1788, was organized as a town in 1793, and was chartered as a city in 1894. Under the charter of 1895 the government is vested in a mayor, elected annually, and a city council, of which the mayor is a member. The city owns and operates its water works and sewage system. Pop., 1900, 8448; 1910, 10,734.

BARRE, bâr, ANTOINE JOSEPH LE FÈVRE DE LA. See LA BARRE.

BARRÉ, bâr'ê, ISAAC (1726-1802). A British officer and politician, born at Dublin. He was a lieutenant colonel in Wolfe's army and was wounded at the capture of Quebec in 1759. He was chosen to Parliament in 1761 and attracted attention by a violent personal attack upon Pitt, who led the opposition to Bute's administration. He opposed the Stamp Act in 1765, supported the appeal of the Colonies, and strenuously defended the American cause, for years making himself conspicuous in the various debates by his remarkable powers of invective. The "Sons of Liberty" derived their name from a chance allusion to the Americans in one of his speeches. He held various offices of importance and was in Parliament until 1790, when he retired in consequence of blindness resulting from his wound received at Quebec. He was among those to whom the Junius Letters were attributed.

BARREL (It. *barile*; Fr. *baril* = *barrique*, Gael. *barail*, Ir. *bairile*, Slav. *barilo*). Primarily a large cylindrical vessel for holding liquids, and then, by extension, a certain measure, but varying in every locality and almost for every liquid. In the old English measures the barrel contained 31½ gallons of wine, 32 of ale, and 36 of beer, the wine gallon itself differing from that of ale and beer. In imperial gallons their contents would be: old wine barrel = 26¼ gal.; ale barrel, 31½; beer, 36½. The Italian *barile* varies from 7 to 31 English gallons; the French *barrique* of Bordeaux = 228 French litres = 50 English gallons. Four *barriques*

make a tonneau. In many cases, barrel signifies a certain *weight* or other quantity of goods usually sold in casks called barrels.

In the United States the usual barrel for liquids contains 31½ United States wine gallons of 231 cubic inches. A standard barrel of fermented liquors for tax purposes (Revised Statutes 3339) contains not more than 31 gallons and is the basis upon which the internal revenue tax is collected, while the return of the number of gallons of proof spirit distilled is made on a basis of 40 gallons to the barrel (Revised Statutes, 3309). The United States government has also prescribed a standard barrel for apples by Act of Congress approved Aug. 3, 1912, of which the dimensions, measured without distension of its parts, are as follows: Length of stave, 28½ inches; diameter of head, 17¾ inches; distance between heads, 26 inches; circumference of bulge, 64 inches, outside measurement, representing as nearly as possible 7056 cubic inches. Steel barrels containing the interior dimensions provided for above are to be construed as a compliance therewith. The statutes of the various States provide for the dimensions of barrels and casks used for various commodities; for example, in the Consolidated Laws of the State of New York it is provided: that casks for flour and meal shall be of two sizes only. One size shall contain 196 pounds of flour or meal, with staves 27 inches long and each head 16½ inches in diameter; and the other size shall contain 98 pounds, with staves 22 inches long and each head 14 inches in diameter, or with staves 27 inches long and each head not more than 12 inches in diameter. Another typical statute is that of the State of Wisconsin, which provides that a barrel shall contain 31½ gallons and a hogshead two barrels, . . . a barrel of flour measured by hundredweight shall contain 196 pounds; a barrel of potatoes, 172 pounds; a barrel of unslacked lime, 200 pounds; a barrel of apples or pears shall represent a quantity equal to 100 pounds of grain or dry measure, etc. Numerous attempts have been made to secure a greater uniformity in barrels, especially those employed for agricultural products, and much progress recently has been made in that direction. See COOPERAGE.

BARREL, GUN. See ORDNANCE, SMALL ARMS.

BARREL BULK. A measure equal to 5 cubic feet, or one-eighth of a ton. It is used in estimating capacity for freights, 40 cubic feet being taken as one ton in estimating freight charges, where the latter are not based upon the weight.

BAR/REL-MAK'ING MACHIN'ERY. See COOPERAGE.

BARREL ORGAN. A musical instrument generally portable, in which the music is produced by a revolving barrel or cylinder, set with pins and staples, which open valves for admitting wind to pipes from a bellows worked by the same revolving cylinder. The pieces are played with an harmonic accompaniment. Barrel organs are mostly used by itinerant musicians, and their repertoire is limited. The *orchestron* is a very large barrel organ, established chiefly in restaurants, dancing halls, and carroussels.

BARREL VAULT. An architectural term for a continuous semi-cylindrical vault whose section may be semi-circular, semi-elliptical, segmental, or pointed. In engineering works it is commonly called a tunnel vault. See VAULT.

BAR/REN IS/LAND. A volcanic islet in the Bay of Bengal, 60 miles east of Andaman Islands (Map: Burma, B 4). It is conical in shape, about 2 miles in diameter, and its cone rises to a height of 1158 feet. The volcano is in a semi-dormant state, emitting at intervals water and sulphurous gases.

BARREN MEAS/URES. See CARBONIFEROUS SYSTEM; COAL.

BAR/RENNESS. See STERILITY.

BARRÈS, bâ'rès', MAURICE (1862-). A French novelist, born at Charmes-sur-Moselle. His early works, *Sous l'ail des barbares* (1888); *Un homme libre* (1889), and *Le jardin de Bérénice* (1891), are obscure, uneven, and decadent. His intentional lack of unity, his fondness for interspersed and sporadic criticism, must be held to have influenced George Moore in his remarkable, yet tantalizing, *Confessions of a Young Man*. In his later efforts Barrès works himself out of aristocratic dilettantism and writes the "romance of national energy," urging young men to remain in the provinces and build up national traditions. This is expressed in his cycle of three stories, *Les déracinés* (1897), *L'Appel au soldat* (1900), and *Leurs figures* (1902). Still carrying on the gospel of national energy comes a new series, "Ramparts of the East," of which the first volume, *Au service de l'Allemagne* (1905), deals with Alsace. Later of his writings include *Le voyage de Sparte* (1906); *Colette Bandoche* (1900); *La maîtresse servante* (1911); *En Italie* (1912). In 1906 he was elected to the Academy and reelected, as a Nationalist, to the Chamber of Deputies, which he entered in 1889. Consult, for criticism, Kahn, *Symbolistes et décadents* (Paris, 1902) and J. G. Huneker, *Egoists, a Book of Supermen* (New York, 1909); and for biography Barrès himself, *Vingt-cinq années de vie littéraire* (Paris, 1908).

BAR/RETT, BENJAMIN FISK (1808-92). An American Swedenborgian minister. He was born in Maine and graduated at Bowdoin in 1832 and at Harvard Divinity School in 1838. He was pastor of the First New Church (Swedenborgian) in New York from 1840 to 1848, at Cincinnati from 1848 to 1850, and at Philadelphia from 1864 to 1871. He edited the *New Church Monthly*. His works include a *Life of Swedenborg* (1841); *Lectures on the New Dispensation* (1878); *Letters on the Divine Trinity* (1873); *The Golden Reed* (1855); *A New View of Hell* (1872; 1886).

BARRETT, CHARLES SIMON (1866-). An American agriculturist, and president of the Farmers' Union. He was born in Pike Co., Ga., received a normal-school education, and engaged in teaching and farming until 1897, when he became an organizer among the farmers. In 1905 and 1906 he was president of the Georgia Farmers' Union, in the latter year becoming head of the national organization, which comprises 2,500,000 members in 31 States. He was a member of Roosevelt's Country Life Commission and a delegate to the National County Life Congress of 1911. He published *Mission, History, and Times of the Farmers' Union* (1909).

BARRETT, JOHN (1866-). An American journalist and diplomat, born at Grafton, Vt., in 1866. He graduated from Dartmouth College and, after teaching for some time, was associated with several important newspapers on the Pacific coast. He was appointed Minister to Siam in 1894, resigning in 1898 to act as war correspondent in the Philippine Islands. He was

Minister to Argentina (1903-04), to Panama (1904-05), and became Minister to Colombia in 1905. Mr. Barrett has done much to promote American commercial interests both in Asia and in South America. In 1906 he became director-general of the International Bureau of Pan-American Republics, later the Pan-American Union. He published *Admiral George Dewey* (1899); *Pan-American Union: Peace, Friendship, Commerce* (1911); *The Panama Canal and What it Means* (1913).

BARRETT, LAWRENCE (1838-91). An American actor, born at Paterson, N. J. For a time he worked in a dry-goods shop at Detroit, Mich., and in that city, in 1853, as Murad in *The French Spy*, made his first stage appearance. In 1857-58, at New York and Boston, he supported Edwin Booth, E. L. Davenport, and other prominent players. In 1861 he served in the Federal army as captain in the Twenty-eighth Massachusetts Volunteer Infantry. Subsequently he became the leading member of Edwin Booth's company during a remarkable series of performances at the Winter Garden, New York City. For several years he managed, with heavy pecuniary loss, the Varieties Theatre, New Orleans, La., but in 1869-70 won brilliant artistic and financial success as copartner with John McCullough of the California Theatre, San Francisco. At Booth's Theatre, New York City, he appeared in 1875 as Cassius and the King, in magnificent revivals of *Julius Caesar* and *King Lear*. In 1884 he was favorably received during a brief visit to England. From 1887 until his death he was associated with Edwin Booth in one of the most significant enterprises in the history of the American drama. His greatest part was that of Cassius; but he was likewise highly effective as Hamlet, King Lear, Shylock, Riche-lieu, Lanciotto, and the Man o' Airle. In general, it may be said that his work was marked by fine conscientiousness and high intellectual force, although not credited by the critics with the touch of distinctive genius displayed by his coworker, Booth. He was an energetic manager, did much to encourage dramatic authorship, and wrote a discriminating and very readable *Life of Edwin Forrest* (1881), and an admirable sketch of Edwin Booth in *Edwin Booth and his Contemporaries* (Boston, 1886).

BARRETT, WILLIAM FLETCHER (1844-). An English physicist, born in Jamaica, West Indies. From 1862 to 1866 he was assistant to Professor Tyndall at the Royal Institution, London; in 1867 was appointed instructor in science at the International College; in 1869 lecturer in physics at the Royal School of Naval Architecture, and from 1873 to 1910 he was professor of experimental physics at the Royal College of Science, Dublin. He helped found, in 1882, the Society for Psychical Research, whose purpose was defined as "an organized attempt to investigate that large group of debatable phenomena designated by such terms as mesmeric, psychical, and spiritualistic." In 1885 he established in the United States a branch of the society. He is known for original investigations in magnetism and radiant heat, which include discussions of the contraction of nickel by magnetization, sensitive flames, and the recalcrescence of iron. His publications, in addition to numerous contributions to the *Philosophical Magazine* and other periodicals, include *Lessons in Science* (1880); *A Monograph on the So-called Divining Rod* (1897-1900); *Early Chapters in Science*

(1899); *Introductory Practical Physics* (with W. Brown, new ed., 1906); *A New Form of Polarimeter* (1909); *Open-Scale Isothermal Air Barometer* (1910); *Creative Thought* (1911); *Swedenborg, the Savant and the Seer* (1913).

BARRETT, WILSON (1846-1904). An English actor, manager, and playwright. He was born in Essex, Feb. 18, 1846, and went upon the stage at Halifax in 1864. After playing in different provincial towns he became manager of the Amphitheatre, at Leeds, and of other play-houses. In 1879, three years after his first appearance in London, he took the management of the Court Theatre, the next year securing Madame Modjeska for her first English appearance. He became manager of the Princess's Theatre in 1881 and produced *The Lights o' London*, which ran for 286 nights. In 1882 came *The Silver King*, with Barrett's rôle of Wilfred Denver, which had an even longer run. His *Hamlet* was first presented in London in October, 1884. This was his best Shakespearean part, the other most notable being *Othello* (1897). In 1886 he produced *Clito*, a tragedy written by himself and Sydney Grundy. His own drama of *Nowadays* he brought out in 1889, and his *Pharaoh*, at Leeds, in 1892. The most successful of his own plays was *The Sign of the Cross*, founded on legends of the early Christian martyrdoms under Nero. Produced in America in 1895, it met with great popular favor, and though severely dealt with by some of the critics, had a run of more than a year at the Lyric Theatre, London, which Barrett took in 1896. There, in February, 1897, he produced his *Daughters of Babylon*. He also produced his own adaptations of several novels, among them Hall Caine's *Deemster* (as *Ben my Chree*, 1888), *The Bondman* (1893), *The Manzanar* (1894), and Sienkiewicz's *Quo Vadis?* (at Edinburgh, May, 1900). He was author or joint author of several works of fiction, among them novels based on *The Sign of the Cross* and *Daughters of Babylon*.

He came to America for more or less extended tours in 1886, 1888, 1889, 1893, and 1897. In 1898 he visited Australia. In 1899 he became manager of the Lyceum. Consult Scott, *The Drama of Yesterday and To-day* (London, 1899).

BARRHEAD. A police burgh in Renfrewshire, Scotland, 3½ miles southeast of Paisley. Cotton mills, bleaching, weaving, dyeing, engineering, and other works combine with its railway facilities to make it a busy and thriving town. It was founded in 1773. Pop., in 1911, about 10,000.

BARRI, GIRALDUS DE. See GIRALDUS DE BARRI.

BARRIAS, bâ'rê-âs, ERNEST (1841-1905). A French sculptor, born in Paris. He was a pupil of Cavehler and Jouffroy. In 1861 he won the *Prix de Rome*. He gained his first noteworthy success in 1870 with a "Young Girl of Megara" (Luxembourg). His best-known work is "The First Burial" (1883, Hôtel de Ville; a bronze replica in Metropolitan Museum, New York City); and his later productions include the "Young Mozart" (1887, Luxembourg); "The Girl Spinning"; the celebrated monument of Victor Hugo (1902, Paris); and "Joan of Arc as a Prisoner" (1903). His style is marked by an attempt at compromise between academic classicism and modern naturalism.

BARRIAS, FÉLIX JOSEPH (1822-1907). A French historical and portrait painter, brother of the preceding. He was born in Paris. He

studied with Léon Cogniet and in 1844 took the *Grand Prix de Rome* with "Cincinnatus Receiving the Deputies of the Senate." For half a century he was known as one of the most earnest champions of academic tendencies, especially in historical painting. For 60 years he was an almost annual exhibitor in the Salon. Among his chief works of this class are "Pilgrims going to Rome for the Jubilee of 1300" (1855), "Socrates Bidding Farewell to his Friends" (1873); "The Death of Chopin" (1885). Between 1860 and 1875 he was especially active in mural decorations, of which specimens are to be seen in the Hôtel du Louvre, the churches of St. Eustache and the Trinité, and the foyer of the Opéra, Paris; and at Grosvenor House, London.

BARRICADE (Fr., Sp. *barricada*, literally, made of barrels, from *barrica*, barrel). An improvised defensive work, employed to bar narrow passages, streets, roads, etc. When built by regular troops, use is made of beams, chains, *chevaux-de-frise*, and other specially adapted materials; if erected by civilians or mobs, any available material that may be at hand is used. Barricades have been used since the earliest times, but are perhaps better known in connection with the insurrections in the city of Paris. (See below.) After his ascension to the throne Napoleon III widened the principal streets of Paris and laid them with asphalt, so as to render the successful erection of barricades next to impossible.

BARRICADES, THE DAYS OF THE. A phrase applied to popular uprisings in Paris. The first was May 12, 1858, when the people rose against the Duc de Guise and barricaded the streets; another, Aug. 5, 1648, when the people rose at the commencement of the Fronde; others, again, in July, 1830, and in February, 1848.

BARRIE. The capital of Simcoe Co., Ontario, Canada, 63 miles northwest of Toronto on the Grand Trunk, the Canadian Pacific, and the Hamilton and Northwestern railways, and on Lake Simcoe (Map: Ontario, D 3). It is a favorite summer resort and is the centre of a grain-raising district. The manufactures include carriages, leather, and wicker work, and there are foundries, breweries, woolen, flour, and planing mills, etc. There is a business college at Barrie. Pop., 1901, including Allandale, 5949; 1911, 6420.

BARRIE, SIR JAMES MATTHEW, Bart. (1860-). One of the most popular of contemporary novelists and dramatists, born at Kirriemuir, Scotland. The sketches and stories which he contributed to papers and periodicals soon after his graduation from Edinburgh University in 1882 brought him to the attention of the British public and made him within a few years first without a second among the recent writers who have found their material in the village and country life of Scotland. In 1885 he moved to London. With the publication of *Auld Licht Idylls* (1888) and *A Window in Thrums* (1889) the author's success was assured. *The Little White Bird* (1892) and *Sentimental Tommy* charmed his old readers and won him a host of new ones. These four books represent and measure the distinctive genius or talent of their author. The painting of homely Scotch life, the tricky wit, the fresh vernacular style, the pervasive sentiment, the overflowing pathos—these were the making of the *Idylls* and *A Window in Thrums*, while his tenderness for child life, his poetic fantasy, and his whimsical

invention created *Sentimental Tommy*, *The Little White Bird*, and their like. Many successes followed the "Thrums" idylls; among them, in addition to the books already named, *My Lady Nicotine* (1891), *The Little Minister* (1891), and *Tommy and Grizel* (1900). By 1900 the struggling journalist of the early nineties had become one of the most popular writers of his time. And other laurels in a new field had been won. In 1892 his farce, *Walker, London*, scored a success, and one of the actresses who had a part in that play became his wife in the following year—a marriage that ended in a divorce in 1909. Other plays, some of them based on his work in fiction, were still more successful: *The Professor's Love Story* (1895); the stage version of *The Little Minister* (1897); *Quality Street*, *The Admirable Crichton*, and *Little Mary*, all produced in the year 1903. *Peter Pan*, a fantasy elaborated from an episode of *The Little White Bird* and worthy of Hans Andersen, belongs to 1904, and *Alice-Sit-by-the-Fire* and *What Every Woman Knows* respectively to 1905 and 1908. He was made a baronet in 1913. As a dramatist Mr. Barrie is not in the main current of present-day dramatic activity, which runs to the problem play; his sphere is the comedy of manners and the fantasy, and within this sphere his freshness of invention, his stage craft, the spontaneity of his humor, his genial if not incisive satire, and an engaging personality have secured him a distinguished place. A sound criticism of Barrie is contained in Stevenson's comment in a letter (Dec. 22, 1892) to Henry James, "There was genius in him, but there was a journalist on his elbow." If not weighty, deep, or searchingly sincere in either novel or drama, his work has a kindly humanity, a whimsical humor, a grace of sentiment, and a bizarre fancy that have cast an unailing spell over a vast and varied audience. The following, with the books already named, comprise the bulk of his work: *Better Dead* (1887); *When a Man's Single* (1888); *An Edinburgh Eleven* (1888); *Margaret Ogilvie* (1894); *The Wedding Guest* (a play, 1900); *Peter Pan in Kensington Gardens* (1906); *George Meredith* (1909); *Half an Hour*, *The Will*, *The Adored One* (or *Leonora*)—the first and third of these produced in London, the first two in New York, 1913, and *Leonora*, 1914, with Maude Adams. A 10-volume edition of Barrie's *Works* was published in London, 1913. For biographical and critical material, consult J. A. Hammerton, *Barrie and his Books* (New York, 1900), which contains a list of articles on Barrie and his work. Consult also *English Illustrated Magazine*, vol. xxix (N.S.), p. 208, for bibliography of Barrie's work to May, 1903.

BARRIÈRE, ba'ryar', JEAN FRANÇOIS (1786-1868). A French publicist, born in Paris and educated at the Academy of St. Barbe. He held various journalistic positions and in 1833 became associated with the *Journal des Débats*, to which, until his extreme old age, he was one of the most active contributors. He devoted himself principally to historic sketches and studies of the eighteenth century and the Revolutionary period. Among his principal works are the following: *Mémoires de Mme. Campan* (2 vols., 1823); *Bibliothèque des mémoires relatifs à l'histoire de France pendant le XVIII^e siècle* (12 vols., 1846-49).

BARRIÈRE, THÉODORE (1823-77). A French

dramatic author, born in Paris. His first notable success was a dramatization of Murger's *La vie de Bohème* (1851). This was followed by two other of his best plays—*Les filles de marbre* (1853) and *Les faux bonshommes* (1856). *Le Gascon* (1873) was a great success. He also published *Les Scandales d'Hier* (1875); *Les Demoiselles de Montfermeil* (1877), and also many plays in collaboration with E. Capendu, Ed. Plouvier, V. Sardou, and others.

BARRIER FORTS, THE. A series of batteries built by the Chinese on the Chu-kiang River, several miles south of Canton, and so named because at this point, during the "Opium War" with England in 1840–42, a barrier of heavy piles and sunken vessels was constructed to keep out foreign shipping. On Nov. 15, 1856, the Chinese fired without provocation on several American officers, including Captain (later Rear-Admiral) A. H. Foote, who were approaching the forts in an open boat; and in retaliation, Commodore Armstrong, then commanding the American fleet in Chinese waters, captured the forts by storm, on the 21st, the Americans losing 29 in killed and wounded, the Chinese fully 300. The forts were later demolished by the Chinese. See **BOGUE FORTS**; **BOCA TIGRIS**.

BARRIER REEF, THE GREAT. A chain of coral reefs off the eastern coast of Queensland, Australia (Map: Queensland, E 4). It extends from Sandy Cape to Torres Strait, a distance of about 1000 miles in a general northwest direction. It follows rather closely the windings of the coast as far as Cape Direction (12° 51' S.). Here it diverges in a northerly direction to Anchor Cay (9° 22' S., 144° 6' E.), which is its northwestern extremity. Yule and Olinda entrances are possible for navigation, but are not very safe. The Pandora passage is more advantageous. The greatest distance of its outer edge from the coast is 140 miles from Port Clinton, and its nearest approach is 12 miles north of Cape Melville. The sea between the coast and the reefs is calm, and the channel is used by steamers, but is dangerous for sailing vessels. The reefs protrude above the surface at low tide, and even at high tide, when invisible, their location is indicated by the turbulent state of the water. The area covered by the reefs is estimated at 100,000 square miles. Pearls, pearlshells, and trepang are obtained from the reefs and surrounding waters. The name is given also to a similar formation extending along the coast of New Guinea from Cape Suckling to South East Cape and along the southern and eastern shores of the Louisiade Archipelago. Consult *Australia Directory*, vol. ii (6th ed.), comprising the East Coast from Port Jackson to Cape York, etc. (London, 1907).

BARRIERS, BATTLE OF THE. A battle fought between the French and the Allied troops under the walls of Paris (1814), in which the latter were victorious. After this battle Napoleon abdicated.

BARRIER TREATY. A treaty framed in 1715 after the Peace of Utrecht, confirming treaties concluded between England and the Netherlands in 1709 and 1713. Consult Dumont, *Corps diplomatique* (Amsterdam, 1726–31).

BARRILI, bār-rē'lē, ANTONIO GIULIO (1836–1909). A popular and highly prolific Italian novelist, author of some 70 romances (published by Treves, Milan), of which *Come un sogno* is representative.

BARRINGER, bār-rin-jēr, RUFUS (1821–95).

An American lawyer, born in Cabarrus Co., N. C. He graduated at the university of his native State, studied for the bar, and afterward settled at Concord to begin the practice of the law. He was elected to the Legislature in 1848 and became a State Senator in 1850. Although strongly in favor of the continuance of the Union, he nevertheless, when the Civil War broke out, cast in his lot with his native State, joined a cavalry regiment, and gradually rose to the rank of brigadier general. After the war, he returned to the practice of law at Charlotte, where he remained until 1884, when he retired and thereafter until his death devoted himself to the management of his farm.

BAR/RING-OUT. A prank once common among schoolboys in Great Britain. On the eve of a holiday the boys would attempt to bar the master out, it being understood that if they succeeded in preventing his entrance for three days they might dictate terms regarding holidays and recreation for the ensuing year, but if they failed they were at the master's mercy. Even the gentle Addison is reported by Johnson to have been a leader in an escapade of this kind at Lichfield. Though not unknown in the United States, barring-out has been here practiced for pure mischief, with no ulterior purpose.

BAR/RINGTON, DAINES (1727–1800). An English lawyer and antiquary. He was called to the bar at the Inner Temple, from 1751 to 1753 was marshal of the High Court of Admiralty, and in 1764 became recorder of Bristol. From 1778 to 1785 he was second justice of Chester. He also held appointment as King's counsel and as commissary-general of the stores at Gibraltar. His antiquarian papers, read before the Society of Antiquaries and the Royal Society, deal with a multitude of varied subjects, from the antiquity of playing cards to Julius Caesar's landing in Britain. His learning was more extensive than accurate, and his curious blunders, due often to his gullibility, exposed him to no little ridicule. His edition (1773) of Alfred the Great's Anglo-Saxon version of *Orosius*, with a translation, has been discredited. The best known and most valuable of his writings is the *Observations on the Statutes* (1766), a discursive work, with no evidence of arrangement, but still valuable for its ingenious and learned notes. He corresponded with Gilbert White, of Selbourne, whose *Natural History*, it has been asserted, was prepared at his suggestion. After he had become a bencher of the Inner Temple, he was much in the Temple Gardens, where he was familiar with Charles Lamb, who calls him "another oddity," and says that "he walked burly and square." Consult Nichols, *Literary Anecdotes of the Eighteenth Century* (9 vols., London, 1812–15).

BARRINGTON (properly, **WALDRON**), GEORGE (1755–c.1840). An Irish author, born at Maynooth, county Kildare. He attended schools there and at Dublin and in 1771 joined a band of strolling players. Subsequently he set up in London as a polite pickpocket, his most noted professional exploit being the theft from Prince Orloff of a snuffbox roughly valued at £30,000. He was sentenced in 1790 to seven years' transportation, but during the voyage to Botany Bay he frustrated an attempted mutiny and in 1792 received the first emancipation warrant ever granted. He was long superintendent of convicts, and afterward high constable at

Parramatta. For the opening of the theatre at Sydney with the presentation by the convicts of Dr. Young's *Revenge*, he wrote the prologue containing the well-known lines—

"True patriots we, for be it understood,
We left our country for our country's good."

He published *A Voyage to Botany Bay* (1801), *The History of New South Wales* (1802), and *The History of New Holland* (1808).

BARRINGTON, JOHN SHUTE, first VISCOUNT (1678–1734). An English lawyer and polemical writer. He was born in London and was educated at the University of Utrecht, where he remained for four years. After his return to England in 1698 he published two treatises, *An Essay upon the Interests of England in Respect to Protestants Dissenting from the Established Church* (1701) and *The Rights of Protestant Dissenters* (1704–05). He was one of the commissioners sent to Scotland to win the support of the Presbyterians for the union between the two kingdoms, and in 1708 he was appointed a commissioner of customs. He was a member of the House of Commons from 1715 to 1723. Swift described Barrington as "the shrewdest head in England." He was the author of numerous religious essays, collected and published by the Rev. George Townsend, under the title of *The Theological Works of the First Viscount Barrington* (3 vols., 1828).

BARRIOS, bā'r'rē-ōs, RUFINO (1835–85). A Guatemalan politician, born at San Lorenzo. In 1871 he was prominent in the overthrow of President Cerna, and under President Granados became commander in chief of the army of Guatemala. He was president of Guatemala from 1873 until his death. Despite many dictatorial measures he did much to promote civil order and prosperity. He attempted to unite the five Central American States in a confederation; but Salvador, Nicaragua, and Costa Rica leagued against him, and during an invasion of Salvador he was killed at Chalchuapa.

BAR/ISTER (earlier *barester*, *barraster*, from *barric*, bar). The distinctive name by which the advocates at the English and Irish bars are known. (See **BAR**.) They are admitted to their office under the rules and regulations of the Inns of Court, and they are entitled to exclusive audience in all the superior courts of law and equity, and generally in all courts, civil and criminal, presided over by a superior judge. In the county courts attorneys are allowed to practice without the assistance of counsel; also at petty sessions, though at the quarter sessions where four counsel attend, the justices always give them exclusive audience. In Scotland the same body are styled advocates, and they have the same exclusive privileges that barristers enjoy in England and Ireland. Of barristers there are various ranks and degrees, and among each other they take precedence accordingly, the general name, "counsel," being, in the practice of the court, common to them all. But they may be divided into two leading groups—barristers and King's counsel. The ancient order of sergeants-at-law, formerly a well-marked third group, was distinguished by the *coif* and other peculiarities, but has now ceased to exist. (See **SERGEANT-AT-LAW**.) Besides these three orders of gradations of rank at the English bar, the crown sometimes grants letters patent of precedence to such barristers as his Majesty may think proper to honor with that mark of dis-

inction, whereby they are entitled to such rank and pre-audience as are assigned to them in their respective patents. Persons who desire to become barristers must secure admission to one of the Inns of Court and, after keeping a prescribed number of "terms," must pass a "call examination" successfully and thus entitle themselves to be called to the bar. The fees which the candidate must pay on being called, before signing the roll of barristers in the King's Bench Division of the High Court of Justice, are quite onerous, ranging from £90 to £100. He remains subject to the discipline of his Inn, which has the power to "disbar" him upon criminal conviction or for gross professional misconduct.

The professional ethics, or etiquette, of the bar is carefully and accurately defined. Its principal rules are as follows: "(1) That fees are divided between a leader (who ought to be a King's counsel, a sergeant, or a barrister with a patent of precedence) and a junior in the proportion of three-fifths to the former and two-fifths to the latter; (2) that no barrister accepts business upon a circuit to which he does not belong, except for a special fee; (3) that all litigious business must come through a solicitor, though a barrister may advise a client, directly and personally, as to non-litigious matters (such as making his will, or a settlement of his property); (4) a barrister's fee is an *honorarium*, not recoverable by legal process." As a barrister cannot enforce payment for his services, the law exempts him from liability for negligence in the performance of his professional services.

There is no distinct order of counsel corresponding to barristers in the United States, the functions of counsel, or advocate, and of attorney, or solicitor, being performed by the same person.

BARROIS, bā'r'wā', CHARLES (1851–). A French geologist and paleontologist. He was born at Lille and was educated at the university there, where he afterward held the chair of natural sciences. He had charge of the official geological corps in Brittany, and contributed important papers descriptive of the geological structure and the fossils of that region. He was an active member of the Société Géologique du Nord and of the Société Géologique de France and served as general secretary, and as secretary of committees of the International Geological Congress. Among his literary contributions to the sciences are: *Traité de Paléontologie*, 5 vols. (Paris, 1883–93), which is a translation of Zittel's *Handbuch der Paläontologie*. The following monographs embody the results of part of his researches on the geological formations of France and the neighboring countries: *Le terrain crétacé supérieur de l'Angleterre et de l'Irlande* (1876); "Les terrains anciens des Asturies et de Galice," in *Mémoires Soc. Géol. du Nord*, vol. ii (1882); "Faune du calcaire d'Erbray (Loire-Inférieure), contribution à l'étude du terrain dévonien de l'ouest de la France," in *Mémoires de la Société Géologique du Nord*, vol. ii (1889); "Mémoire sur le terrain crétacé du bassin d'Oviédo (Espagne)," in *Annales des Sciences Géologiques*, vol. x (1879); "Mémoire sur la distribution des graptolites en France," in *Annales de la Société Géologique du Nord* (1892); "A Geological Sketch of the Boulonnais," in *Proc. of the Geologists' Association*, vol. vi (1880); "Sondages aux environs de

Lille," in *Annales de la Société Géologique du Nord*, vol. xxvi (1897). He became a member of the Institute in 1904.

BARRON, JAMES (1769-1851). An American naval officer. He was born in Virginia, went to sea at an early age, commanded several merchantmen, and in 1798 entered the United States navy as first lieutenant. In 1806 he was promoted to be commodore and in the following year commanded the *Chesapeake*, when that vessel was attacked and forced to surrender three of her crew, alleged to be British deserters, by the British frigate *Leopard*. (See **CHESAPEAKE, THE**.) Barron, though only in part to blame for the tame submission of his vessel, was bitterly attacked throughout the country, was tried by court-martial, and found guilty of "neglecting, on the probability of an engagement, to clear ship for action," and was suspended from active service for five years. Though he was subsequently assigned to shore duty, he never afterward was in active service and never regained his old professional status. Believing himself to be the victim of persecution at the hands of a cabal of officers, headed by Decatur, he challenged the latter and on March 22, 1820, mortally wounded him in a famous duel at Bladensburg, Md. Barron, though also seriously wounded, finally recovered and in 1839 became the senior officer in the United States navy.

BARRON, SAMUEL (1763-1810). An American naval officer. He was born at Hampton, Va., and was the brother of James Barron. He commanded a fleet of 10 vessels in the operations against Tripoli in 1805, but in consequence of ill health resigned his command in favor of Commodore John Rodgers. Just before his death Barron was made commander of the Gosport Navy Yard.

BARROS. A town in Porto Rico, 11 miles northwest of Aibonito, and 31 miles northeast of Ponce (Map: Porto Rico, D 3). It is situated in the midst of beautiful mountain scenery. The inhabitants are engaged chiefly in raising fine cattle and in the growing of coffee. Pop., 1899, 14,845; 1910, 15,028.

BARROS, BARRÓS, ARANA DIEGO (1830-). A Chilean historian, born at Santiago. He was forced by ill health, in 1849, to abandon the practice of the law, for which he had been prepared, gave himself up to historical studies, and became known as an authority on the history of his country. He was a constant traveler and collected information from all possible sources on his favorite subject. In 1863 he was made rector of the Instituto Nacional. Among his publications are: *Estudios históricos sobre Vicente Benavides y la compañía del sur 1818-21* (1850); *Historia de la independencia de Chile* (1854-58); *Historia de la literatura* (1870); *Histoire de la guerre du Pacifique* (1881, written by order of the government); and *Historia general de Chile* (12 vols., 1884-93).

BARROS, JOÃO DE (1496-1570). One of the most important of the early Portuguese historians. He was born at Vizeu and became page to the Crown Prince (afterward John III), for whose amusement he wrote his three-volume romance, *Cronica do Emperador Clarimundo* (Coimbra, 1520). After the accession of King John III Barros was appointed successively captain of the fortress São Jorge de Mina, governor of the Portuguese possessions in Guinea, and in 1533 treasurer and general agent for Portuguese India. In 1539 he received from the

King a grant of a province in Brazil, but an attempt to colonize it proved so ruinous that he was glad to return the grant. Barros's chief work was his *Decadas* (1552-53, 1560, 1602), a history of Portuguese India, written in fulfillment of a royal commission, left unfinished at his death and completed in 1602 by Diogo do Couto, who added eight more volumes. In this work De Barros had both an artistic and a scientific point of view. He has a keen sense of the picturesque and of the psychological, makes a critical use of his sources, judges with penetration men and events, holding in view the correlation of facts and striving for synthetic effects. A complete edition appeared at Lisbon in 24 vols. (1778-88). Consult Manoel Severin de Faria, *Vida de João de Barros* (Lisbon, 1624), A. Loiseau, *Histoire de la littérature portugaise*, chap. ix (Paris, 1887), and Ross's trans. of Bouterwek, *History of Spanish and Portuguese Literature* (London, 1823).

BARROSA, or BOROSA. A village of Spain, 16 miles south-southeast of Cadiz, celebrated as the place where General Graham, in March, 1811, with a handful of English troops, succeeded in gaining over the French, after his Spanish allies had retreated, one of the earliest victories of the Peninsular campaign. In its results the battle was indecisive, and the only thing the English gained was the glory of victory.

BARROT, BARRÔ, CAMILLE HYACINTHE ODILON (1791-1873). A French statesman. He was born at Villefort, Lozère, July 19, 1791. In 1814 he became an advocate in the Court of Cassation at Paris, soon acquiring a high reputation as an eloquent pleader, becoming one of the most influential leaders of the Liberal opposition. He was president at this time of the Society Aide-toi (q.v.). After the Revolution of 1830 he was appointed Prefect of the Department of Seine, and in Lafayette's ministry a member of the Council of State. In a few months, however, he resigned his office of Prefect and declined the post of Ambassador at Constantinople, offered him by Louis Philippe. After Casimir-Périer became Minister, he also lost his place in the Council of State. He now began his career in the Chamber of Deputies as the leader of the so-called "dynastic opposition," and became the hope of all who desired the carrying out of the principles of the July Revolution. He essentially contributed to the removal of the Doctrinaires (q.v.) from office, in February, 1836, and energetically opposed the ministry of Molé, even supporting the Doctrinaires in accomplishing its overthrow, in 1839. The same year he visited England and Scotland. When, in 1840, Thiers was placed at the head of the government, Barrot for the first time declared himself in favor of the ministerial policy on the Eastern Question. On the return of Guizot to office, his opposition to the government was renewed. Taking a conspicuous part in the reform movement of 1847, he attended several of the provincial reform banquets which preceded the Revolution of 1848. On the outbreak of the struggle of February 23, when Louis Philippe called upon Thiers to form a new ministry, Barrot was appointed President. His advice to the King to withdraw his troops proved fatal to the throne of July. In the last sitting of the Chamber of Deputies Barrot supported the claim of the Comte de Paris to the throne, and the regency of the Duchesse d'Orléans. Under the presidency of Louis Napoleon he was for

some time a minister, and conducted the government with success till Oct. 31, 1849, when he retired from active political life. He accepted no office under the Second Empire, but took part in the conference in favor of Poland, held at Paris in 1864. In 1872 he was made a Councillor of State and Vice President of the Council. Consult his *Mémoires posthumes* (Paris, 1875-77).

BARROW. A term applied to several geographical points in honor of the famous traveler, Sir John Barrow (q.v.). The most important of these are Point Barrow, in lat. $71^{\circ} 23' N.$ and long. $156^{\circ} 31' W.$, marking the northern extremity of America; Cape Barrow (q.v.), on Coronation Gulf; Barrow Strait, a channel extending west of Baffin Bay from lat. $73^{\circ} 45'$ to $74^{\circ} 40' N.$, with an average breadth of 40 miles (Map: America, North, C 2). It is a continuation of Lancaster Sound, connecting Baffin Bay with Melville Sound. It was discovered by Parry in 1819.

BARROW. A river in the southeast of Ireland, and next to the Shannon the largest in the island (Map: Ireland, E 4). It rises in the Slieve Bloom Mountains and after a short flow eastward turns south to the Atlantic, where it forms, in conjunction with the Suir (q.v.), the Waterford harbor. Its entire length is about 120 miles, and it is navigable for 300-ton steamers as far as New Ross, about 25 miles from its mouth. Barges ascend as high as Athy, the head of navigation, where the Barrow is connected with the Grand Canal. Its principal tributary is the Nore.

BARROW. An artificial mound of earth or stone, usually erected as a sepulchral monument or tumulus, common in Great Britain. See EUROPE, PEOPLES OF.

BARROW, CAPE. See BARROW, 1.

BARROW, or BARROWE, HENRY (?1550-93). An English church reformer. He took a B.A. degree at Cambridge in 1570, became a member of Gray's Inn in 1576, was interested by John Greenwood in church reforms, and influenced by the works of Robert Browne, founder of the Brownists. In 1586, while studying theology, he visited Greenwood in the Clink Prison and was thereupon seized. He was three times examined by the ecclesiastical authorities and with Greenwood was imprisoned in the Fleet. In collaboration with Greenwood he wrote several tracts and books. He also published the interesting *Brief Discovery of the False Church* (1590). With Greenwood he was, in 1593, indicted for various alleged offenses and hanged at Tyburn. By many he has been regarded as one of the founders of Congregationalism. For an exposition of this view, consult H. M. Dexter, *Congregationalism of the Last Three Hundred Years as Seen in its Literature* (New York, 1880).

BARROW, ISAAC (1630-77). An eminent English theologian and mathematician. He was born in London and was educated at the Charterhouse and the University of Cambridge. He was appointed professor of geometry at Gresham College in 1662 and in the following year was made Lucasian professor of geometry at Cambridge. He resigned the latter appointment in 1669 in favor of his pupil, Isaac Newton. In 1672 he became master of Trinity College and to his efforts is due the foundation of the valuable library of that institution. In 1675 he was nominated vice chancellor of the university. He died two years later at the age of 47. Of his

original mathematical works, the principal are his *Lectiones Geometricæ* (London, 1669) and *Lectiones Opticæ* (Cambridge, 1674). Noteworthy are also his *Euclidis Elementa* (1655), *Archimedis Opera* (1675), and *Apollonii Conicorum, lib. iv* (1675). A Latin edition of his mathematical works, some of which exist also in English translations, was prepared in 1860 by Whewell. The best edition of the *Theological Works* of Barrow, including his Latin poems and a notice of his life by Whewell, has been prepared by the Rev. A. Napier (9 vols., Cambridge (1859)). The Davy Manuscripts in the British Museum contain another excellent biography of Barrow. The mathematical contributions of Barrow paved the way for the introduction of the differential calculus, his treatment of tangents approaching closely the methods of the fluxional calculus of Newton. In another field his *Treatise on the Pope's Supremacy* (posthumous) is generally recognized as one of the very best works of its kind, and no less celebrated are his sermons.

BARROW, SIR JOHN (1764-1848). An English traveler and writer, born at Ulverston. At an early age he devoted himself to the study of mathematics and astronomy. He visited Greenland with a whaler about 1784 and from 1786-91 taught mathematics at Greenwich. In 1792 he received an appointment as private secretary and keeper of accounts to Lord Macartney, Ambassador to China, and availed himself of this opportunity to learn the Chinese language and to collect valuable materials afterward published in part in the *Quarterly Review* and in his *Travels to China* (1804). When Lord Macartney became Governor of Cape Colony, Barrow made extensive excursions in the interior of the country, which he described in his *Travels in South Africa* (2 vols., 1801-04). He returned to London in 1804 and was appointed by Lord Melville Secretary to the Admiralty, which post he continued to hold till 1845. He published: *A Voyage to Cochinchina in the Years 1792 and 1793* (1806); *The Life of Macartney* (2 vols., 1807); *A Chronological History of Voyages into the Arctic Regions* (1818); *An Autobiographical Memoir* (1847); *Sketches of the Royal Society*. More than almost any other Englishman of his time, he promoted Arctic discoveries. His name was given to Barrow Strait, Cape Barrow, and Point Barrow. With him also originated the idea of the Royal Geographical Society, founded in 1830, of which he was vice president till his death.

BARROW, POINT. See BARROW, 1.

BARROW-IN-FURNESS. A seaport and county borough in Lancashire, England, on the southwest coast of Furness Peninsula, on the Irish Sea (Map: England, C 2). It is 8 miles southwest of Ulverston and 18 miles northwest of Lancaster. The town is built on a rectangular plan. The chief of several fine public buildings is the town hall, and the handsome Gothic church of St. George. The municipality maintains a public and branch libraries, a school of science and art; owns its water works, gas, and electric light plants, markets, abattoirs, and cemetery. Its importance as a great manufacturing centre dates from the discovery in 1840 of rich hematite ore in the neighborhood and the subsequent establishment of mines and smelting works. There are several fine docks, and among the numerous industrial establishments are foundries, engineering works, extensive ship-

building yards, ship-armor and wire works, jute and paper factories. Copper as well as iron ore is obtained in considerable quantities near Barrow. The chief export trade is pig iron, steel rails, and ore. Its imports include timber from Sweden and Canada, coal from Wales, and preserved provisions from the United States. A large cattle trade is carried on with Belfast. There is regular steam communication with Glasgow and Belfast and the Isle of Man. The town takes its initial name from Barrow Island, a traditional burial place of Norse rovers, and now the central point of the harbor and the seat of its shipbuilding industries. The interesting and picturesque ruins of the twelfth century Cistercian Abbey of Furness are within 2 miles of the town, and there are ruins of an ancient castle on Piel Island. The island of Walney lies opposite Barrow, and in 1904-05 the British government built there a fort and undertook the erection of a bridge across the narrow channel separating the island and the mainland. In 1847 Barrow was a fishing village of 300 inhabitants. Pop., 1891, 51,712; 1901, 57,584; 1911, 63,775. Consult Richardson, *Furness, Past and Present* (Barrow, 1880).

BARROWS, DAVID PRESCOTT (1873-). An American ethnologist and educator. He was born in Chicago and graduated from Pomona College, Cal., in 1894. Post-graduate studies he took at the University of California, Columbia University, and the University of Chicago, receiving from the last-named institution the degree of Ph.D. in 1897. He spent a number of years in the Philippines, as superintendent of the schools at Manila (1900), chief of the Bureau of Non-Christian Tribes (1901), and as director of education in the islands (1903-09). In 1910 he became professor of education and dean of the Graduate School at the University of California and a year later accepted the chair of political science at that institution. Besides reports on the ethnology of the Philippines and on the progress of education in those islands, he wrote *The Ethno-Botany of the Coahuilla Indians* (1900), and *A History of the Philippines* (1903; new ed., 1912).

BARROWS, ELIJAH PORTER (1807-88). An American clergyman, educator, and author, born at Mansfield, Conn. He graduated at Yale in 1826, was ordained in 1832, and from 1835 to 1837 was pastor of the first Free Presbyterian Church in New York City. From 1837 to 1852 he was professor of sacred literature in Western Reserve College, Ohio, and from 1853 to 1866 professor of Hebrew language and literature at the Andover Theological Seminary. He was appointed in 1872 to the chair of Hebrew at Oberlin College, Ohio. The degree of D.D. was conferred upon him in 1858 by Dartmouth College. He contributed extensively to the *Bibliotheca Sacra*; was an editor of the *Bible With Notes* of the American Tract Society, and published a *Companion to the Bible* (1867), *Sacred Geography and Antiquities* (1872), and *Manners and Customs of the Jews* (1884).

BARROWS, JOHN HENRY (1847-1902). An American clergyman and educator, born at Medina, Mich. He graduated at Olivet College, Mich., in 1867, studied at Yale, Union, and Andover theological seminaries, and, after holding pastorates at Lawrence, Mass., and East Boston, Mass., was pastor of the First Presbyterian Church of Chicago from 1881 to 1896. He organized and was president of the unique

World's Parliament of Religions, held at Chicago, in 1893. In 1896-97 he lectured throughout the Indian Empire. He was Morse Lecturer at the Union Theological Seminary in 1898 and in the same year was elected president of Oberlin College, Ohio. As a pulpit orator and occasional speaker, he was widely and most favorably known. His publications include: *The Gospels Are True Histories* (1890); *I Believe in God* (1891); a *History of the World's Parliament of Religions* (2 vols., 1893); a *Life of Henry Ward Beecher* (1893); *The Christian Conquest of Asia* (Morse Lectures, 1899). Consult M. E. Barrows, *John Henry Barrows: A Memoir* (New York, 1905).

BARROWS, (KATHARINE) ISABEL (HAYES) CHAPIN (1845-1913). An American editor and penologist, born at Irasburg, Vt. After graduating from Adams Academy at Derry, N. H., in 1862, she studied medicine in New York City and received the degree of M.D. Two additional years of study she spent at the universities of Leipzig and Vienna. In 1863 she was married to William Wilberforce Chapin, a missionary to India. He died in 1865, and two years later she became the wife of Samuel June Barrows (q.v.). In early life she was employed by the Department of State at Washington as a stenographer, the first woman to hold such a position in the department. For 20 years she edited the *Proceedings of the National Conference of Charities and Correction*, and for 16 years she was assistant editor of the *Christian Register*. Notable service was rendered by her also as phonographic secretary to the National Prison Association and, during 17 years, as secretary to the Lake Mohonk conferences. Mrs. Barrows was well known as an editorial contributor to *The Independent*, *The Outlook*, *The Survey*, etc. She wrote *The Shaybacks in Camp*, with S. J. Barrows, and *A Sunny Life: The Biography of Samuel June Barrows* (1913).

BARROWS, SAMUEL JUNE (1845-1909). An American author and philanthropist. He was born in New York City, May 26, 1845. After finishing his school days he learned telegraphy and shorthand and became a newspaper reporter. From 1867 to 1869 he was secretary to William H. Seward; in 1870 and 1871, in the bureau of rolls and archives, State Department, Washington; 1871-74, a student in the Harvard Divinity School, Cambridge, Mass., acting also as Boston correspondent of the *New York Tribune*, and in the summer of 1873 he went in this capacity on the Yellowstone Expedition with Generals Stanley and Custer, and in that of 1874 on the Black Hills Expedition. In 1874 and 1875 he was a student in Leipzig. In 1876 he became pastor of the First Church (Unitarian), Dorchester, Boston, Mass.; in 1881, editor of *The Christian Register*, Boston; in 1896, commissioner of the United States on the International Prison Committee. He was a member of the Fifty-fifth Congress (1897-99), and represented the House of Representatives at the Interparliamentary Congress on Arbitration at Brussels (1897), Christiania (1899), and Paris (1900). In the autumn of 1900 he became corresponding secretary of the Prison Association of New York. Besides editing the biography of Rev. Thomas J. Mumford (Boston, 1879), an antiquarian report on the *Records of the First Church, Dorchester, 1634-1736* (1880), the memorial of Ezra Abbot, D.D., LL.D. (Cambridge, 1884),

and Theodore Parker's *West Roxbury Sermons*, 1837-48 (1892), and writing elaborate reports for the United States government on penological matters, he published: *The Doom of the Majority of Mankind* (1883); *A Baptist Meeting-House; The Staircase to the Old Faith, the Open Door to the New* (1885); and (with Mrs. Barrows) *The Shaybacks in Camp* (1887); *The Isles and Shrines of Greece* (1898); *Reports of International Prison Conferences* (1900-05).

BARROW STRAIT. See **BARROW**, 1.

BARRUNDIA, bär-rōn'dé-ä, JOSÉ FRANCISCO (1779-1854). A Central American statesman, born in Guatemala. He was prominent in the revolt against Spain and in 1813 was condemned to death for treason, but made his escape. In 1823-24 he was a member of the first Constitutional Convention of Central America and introduced the measure which effected the abolition of slavery. He was President of Central America in 1829-30 and of the Confederation of Honduras, Nicaragua, and Salvador in 1851-52. In 1854 he came to the United States as envoy from Honduras, with the purpose of negotiating for the annexation of that state to the American republic, but died before anything had been accomplished.

BARRY. A seaport town and railway terminus in Glamorganshire, Wales, 7 miles southwest of Cardiff. It has fine docks, the largest of which was opened in 1889, and a tidal basin covering 90 acres between the mainland and Barry Island. There is a large export trade in coal, and iron and its manufactures. The municipality is particularly progressive; it owns gas and water works, abattoirs, cemeteries, and maintains public schools, a public library, and reading rooms, a large market, now used as a concert hall, garden allotments, parks, several hospitals, and a sanatorium. It initiated the prohibition of unlicensed houses for lodging seamen and instituted a system of licensed houses. Pop., 1891, 13,300; 1901, 27,000; 1911, 33,763.

BARRY (Fr. *barré*, p.p. of *barrer*, to bar). In heraldry, the term applied to a shield which is divided transversely into a certain even number of equal parts by bars of two alternating colors. *Barry-bendy* is where the shield is both barred and bended so as to present a lozenge surface. *Barry-pily* is where the shield is divided by bars and diagonal lines so as to show piles or wedge-shaped figures.

BARRY, ALFRED (1826-1910). An English bishop. He was born in London and was educated at King's College, London, and at Trinity College, Cambridge. He was head master of the grammar school at Leeds from 1854 to 1862 and became principal of Cheltenham College in 1862 and of King's College, London, in 1868. He was appointed examining chaplain to the Bishop of Bath and Wells in 1869, became canon of Worcester in 1871, and canon of Westminster in 1881. From 1884 to 1889 he was primate of Australia, metropolitan of New South Wales, and Bishop of Sydney. He was made canon of Windsor in 1891 and Assistant Bishop in West London in 1897. He was rector of St. James's, Piccadilly, in 1895-1900. He wrote: *Introduction to the Old Testament* (1856); *Lectures on Christianity and Socialism* (1890); *England's Mission to India* (1895); *Hulsean Lectures* (1895); *The Position of the Laity* (1903); *The Christian Sunday* (1905); *The Law of Faith Perfected in Christ* (1908).

BARRY, SIR CHARLES (1795-1860). An English architect. He was born at Westminster, May 23, 1795. Educated at private schools in Leicestershire and Bedfordshire, he was indentured to a firm of architects at Lambeth. At the age of 22 he went to Italy. A wealthy compatriot, attracted by the beauty of his drawings, took him in 1818 to Egypt. He also visited Greece and Palestine. On his return to England, in 1820, he designed a church at Brighton, the Sussex County Hospital, and the Manchester Athenaeum, a building in the Grecian style, and built King Edward's Grammar School at Birmingham, the latter esteemed the most beautiful of his works. In London he designed the very successful Traveler's Club (1832) and the Reform Club (1837), both in Pall Mall, and the College of Surgeons, Lincoln's Inn Fields. After the burning of the old Houses of Parliament in 1834, in a public competition Barry's design for the new building was adjudged the best (1836). The work was commenced in 1840, and on Feb. 3, 1852, Queen Victoria opened the Victoria Tower and Royal Gallery in state and on the occasion knighted the architect. Chosen a Royal Academician in 1844, Sir Charles was also a Fellow of the Royal Society, of the Society of Arts, and of the Institute of British Architects.

BARRY, bá-ré', COMTESSE DU. See **DU BARRY**.

BARRY, EDWARD MIDDLETON (1830-80). An English architect, the son and pupil of Sir Charles Barry, whom he succeeded as architect of the Houses of Parliament. He built the new Covent Garden Theatre, the new opera house in Malta, the Charing Cross and Star and Garter hotels, and the New National Gallery in London.

BARRY, ELIZABETH (1658-1713). A famous English actress, whose dramatic powers seem to have been latent until awakened by her lover, the Earl of Rochester. Though she was more than once dismissed as unfit for the stage, he wagered, so the story goes, that in six months he would make her a first-rate actress. When, after his tuition, she at length appeared at Dorset Garden as the Queen of Hungary in *Mustapha* (1673?), her success justified his prediction. She came to be considered the greatest actress of her time and created, it is said, 112 different rôles. As Monimia, which she played to Betterton's Castalio in *The Orphan*, and as Belvidera in *Venice Preserved*, she was perhaps most celebrated and delighted the heart of their author, Otway, who was devoted to her. Among her other tragic parts were Isabella, in South-ern's *Fatal Marriage*; Zara, in Congreve's *Mourning Bride*; Cassandra, in Dryden's *Cleomenes*; and Calista, in *The Fair Penitent*. She succeeded also in comedy and created the character of Lady Brute, in the *Provoked Wife* of Vanbrugh. Her power of exhibiting every emotion was extraordinary. The utterance of her phrase, "Ah, poor Castalio!" in *The Orphan*, was particularly famous for being always accompanied by her own tears as well as those of the audience. She is stated, on the authority of Cibber (*Apology*, ch. v.), to have been the first actress to receive a "benefit," which in her case was by royal command. She became wealthy and retired from the stage to the village of Acton some three years before she died. Consult: Genest, *History of the English Stage* (Bath, 1832); Cibber, *Apology*, ed. Bellchambers (London, 1822); Doran, *Annals of the*

Stage, ed. Lowe (London, 1888); Baker, *English Actors from Shakespeare to Macready* (New York, 1879); Galt, *Lives of the Players* (London, 1831); Fyvir, *Tragedy Queens of the Georgian Era* (New York, 1909).

BARRY, JAMES (1741-1806). An Irish historical painter. He was born at Cork, Oct. 11, 1741, the son of a sea captain and innkeeper, and studied art in the drawing school of West at Dublin. One of his early paintings attracted the attention of Burke, who brought him to London and enabled him to study for five years in Rome. After his return to London in 1770 his classical paintings caused great controversy and obtained him few commissions; but he was elected to the Royal Academy in 1773. On his own offer he painted, on the walls of the great room of the Society of Arts at the Adelphi, six colossal canvases representing the "Progress of Human Culture." They were all 11 feet 6 inches in height, and the largest were 42 feet long. During the six years required by this work he received no pay, supporting himself by engraving at night. In 1782 he was appointed professor of painting to the Royal Academy, but his criticisms and controversies with the members caused his expulsion from the institution in 1792. After this he lived in poverty and retirement until his death, Feb. 22, 1806. His other paintings, besides the decorations mentioned above, include "Philoctetes in the Isle of Lemnos," "Adam and Eve" (South Kensington Museum), and "Venus Rising from the Sea."

Barry was a man of high ideals, but lacked the technical ability necessary for their expression in painting. A thoroughgoing classicist, he went so far, in his "Death of General Wolfe," as to depict all the figures nude. He was also an etcher and a writer of some force. His letters and writings were collected and published with a memoir in 1809. Consult Colvin, "James Barry," in *Portfolio* (London, 1873); Cunningham, *Lives of the Most Eminent British Painters, Sculptors, and Architects* (London, 1820-33).

BARRY, JOHN (1745-1803). An American naval officer. He was born in Ireland, came to America about 1760, and, settling in Philadelphia, acquired wealth as master of a merchant vessel. He was appointed to command the brig *Lexington* in 1776 and captured the tender *Edward*, the first ship ever taken by a commissioned officer of the United States navy. In 1777 he captured a British war vessel in the Delaware and in 1778 was given command of the *Raleigh*, which was soon afterward pursued and driven ashore by a British man-of-war. In 1781, while returning from France, he captured two vessels, but was severely wounded. He was first senior officer, with rank of commodore, after the reorganization of the navy in 1794. Consult Martin I. J. Griffin, *Commodore John Barry* (Philadelphia, 1903).

BARRY, JOHN DANIEL (1866-). An American playwright, essayist, and writer of novels, born in Boston, Mass. He graduated from Harvard University in 1888 and two years later began literary and journalistic work in New York City, acting for a time as dramatic critic for *Harper's Weekly* and later for *Collier's*. He was made instructor in diction and interpretation at the American Academy of Dramatic Arts, and lecturer on literary and social subjects for the New York City Board of Education. Several plays written by him

were produced successfully in New York and other cities. Besides short stories and essays contributed to magazines, his writings include: *The Intriguers* (1896); *Julia Marlowe* (1899; 1907); *A Daughter of Thespis* (1903); *The Congressman's Wife* (1903); *Our Best Society* (1905); *Idea and Other Allegories* (1913); *Intimations*, a book of essays (1913); *Outlands* (1914).

BARRY, SIR JOHN WOLFE-WOLFE (1836-). An English engineer, born in London, and educated at Trinity College, Glenalmond, and at King's College, London. He was resident engineer during the construction of the bridges over the Thames and the stations at Charing Cross and Cannon Street and afterward built the present bridge over the Thames at Blackfriars, the Barry Dock, near Cardiff (the largest in Great Britain), the Tower Bridge, and numerous railroads and other engineering works. During a visit to the Argentine Republic in 1872 he planned the railroad from Buenos Ayres to Rosario. He was consulting engineer on the underground railway of Glasgow and in 1903-05 was Royal Commissioner of London Traffic. His publications include: *Railway Appliances* (in the series entitled "Text-books of Science," 1874-92); *Lectures on Railways and Locomotives* (1882); *The Tower Bridge* (1894).

BARRY, MARTIN (1802-55). An English physiologist, born at Fratton, Hants. He studied medicine in London, at the University of Edinburgh, and under Tiedemann at Heidelberg. He wrote much on physiological subjects and especially on animal development and embryology. Until the publication of his papers in the *Philosophical Transactions* of the Royal Society of London in 1840-43, it was not known that spermatozoa actually penetrate the ovum. He also first demonstrated the segmentation of the yolk in mammals. His means being ample, Barry gave his professional services freely to the poor. He acted as house surgeon to the Edinburgh Royal Maternity Hospital.

BARRY, SPRANGER (1719-77). A British actor, born in Dublin. He first played at the Theatre Royal in his native city in February, 1744, and remained there two years. On Oct. 4, 1746, he appeared for the first time in London, as Othello at the Drury Lane Theatre, where his gifts were quickly recognized, and it was not long before he and Garrick were playing Macbeth and Hamlet in alternation upon the same stage. But Garrick had control of the house, and in 1750 Barry withdrew to Covent Garden. There he and Mrs. Cibber played Romeo and Juliet, while Garrick and Mrs. Bellamy were appearing in the same piece at Drury Lane, a rivalry continued to the weariness of the town, as expressed in the well-known line, "A plague o' both your houses!" In 1758 Barry planned a new theatre in Dublin and three years later one in Cork; but as a manager he did not succeed, and he returned to London. For a time he played at the Haymarket and then, after 1767, under Garrick's management at Drury Lane. He married Mrs. Dancer in 1768 and went with her in 1774 to Covent Garden. Barry won many laurels in Shakespearean tragedy and created a number of parts, among them Mahomet, in Johnson's *Irene* (1749); Young Norval, in Home's *Douglas* (1757); and Evander, in Murphy's *The Grecian Daughter* (1772). Consult: Genest, *History of the English Stage* (Bath, 1832); Doran, *Annals of the Stage*, ed.

Lowe (London, 1888); Pollock, in *Actors and Actresses of Great Britain and the United States*, ed. Matthews and Hutton (New York, 1886).

BARRY, MRS. SPRANGER (1734-1801), born Ann Street; afterward successively Mrs. Dancer, Mrs. Barry, and Mrs. Crawford. An English actress. She was born at Bath, but her connection with the stage began probably in York or Portsmouth, her early career as an actress being spent with her first husband, Mr. Dancer. In November, 1758, she appeared as Cordelia with Spranger Barry in *Lear*, at his new theatre in Dublin. After several years there she went with him to London (1767), married him the next year, and played with him until his death. Afterward she married a Mr. Crawford, and continued upon the stage for about 20 years, playing in London and for a time (1781-83) in Dublin. She was a powerful actress, with a voice which at vehement moments made an extraordinary impression. Her acting of Desdemona was considered almost a creation of the part, which up to that time had been little thought of. The list of her notable rôles includes also, besides Cordelia, Monimia, in *The Orphan*, and Lady Randolph, in *Douglas*, in which she is said to have made her last appearance, some three or four years before her death. Consult the authorities referred to in the preceding article.

BARRY, THOMAS HENRY (1855-). An American soldier, born in New York City. He graduated at the United States Military Academy and served on frontier and on garrison duty. In 1900-01 he was chief of staff of the Division of the Philippines, and he was made a brigadier general, United States army, in 1903. He was promoted to the rank of major general in 1908, commanded the army of Cuban pacification in 1907-09, and was superintendent of the United States Military Academy from 1910 to 1912.

BARRY, WILLIAM FARQUHAR (1818-79). An American soldier, born in New York City. He graduated in 1838 at the United States Military Academy, assisted Major Ringold in the organization of the first battery of light artillery in the United States army, and served (1846-48) in the Mexican War. He also served in the Seminole War from 1852 to 1853; he was on frontier and garrison duty from 1853 to 1861 and in 1858 was a member of the board for the revision of the system of light-artillery tactics. He entered the Civil War as major of the Fifth Artillery; from 1861 to 1862, with rank of brigadier general of volunteers, was chief of artillery of the Army of the Potomac, and in 1863-64 was chief of artillery of the defenses of Washington, D. C. From 1864 to 1866 he was chief of artillery on the staff of General Sherman (Military Division of the Mississippi) and in 1866 was mustered out of the volunteer service as colonel of the Second Artillery and brevet major general United States army. From 1866 to 1867 (at the time of the attempted Fenian raids into Canada) he was in command of the northern frontier; and from 1867 to 1877 he was in command of the artillery school for practice at Fort Monroe, Va., and from 1877 to 1879 of Fort McHenry, Md. With Gen. J. G. Barnard, he published *Reports of the Engineer and Artillery Operations of the Army of the Potomac* (1863).

BARRY, WILLIAM FRANCIS (1849-).

VOL. II.—46

An English Roman Catholic clergyman and author. He was born in London and was educated at Oscott and the English College, Rome. From 1873 to 1877 he was vice president and professor of philosophy at Birmingham Theological College and professor of divinity at Oscott, 1877-80. From 1883 he was in charge of the small parish of Dorchester, near Oxford, and devoted his time largely to literary work. He delivered addresses in America in 1893. He was appointed rector of St. Peter's, Leamington, in 1908. Besides a large number of articles on metaphysical and ethical subjects, he wrote: *The News Antigone*, a powerful study of modern views in regard to marriage (1887); *The Place of Dreams* (1894); *The Two Standards* (1898); *Arden Massiter* (1900); *The Wizard's Knot* (1901); *The Dayspring* (1903); *Newman* (1904); *Heralds of Revolt* (1904); *Renan* (1905); *The Papal Monarchy from St. Gregory the Great to Boniface, 590-1303* (1902); *The Papacy and Modern Times* (1911).

BARRY, WILLIAM TAYLOR (1785-1835). An American politician and jurist. He was born at Lunenburg, Va., graduated at William and Mary College, and practiced law at Lexington, Ky. Having already served in the State Legislature, he was in 1810 elected to Congress. He fought in the War of 1812, entered the Senate in 1814, and in 1816 resigned to accept an appointment as justice of the State Supreme Court. In 1829-35 he was Postmaster-General, and was the first incumbent of the office to sit in the Cabinet. In 1835 he was appointed Minister to Spain and died on the voyage to that country.

BARRY CORN'WALL. See PROCTER, BRYAN WALLER.

BARRY LYNDON, lin'don. The title of one of Thackeray's lesser novels. It appeared serially in *Fraser* (1844) and narrates the career of an Irish adventurer. It was published in book form in 1853.

BARRYMORE, ETHEL (MRS. RUSSELL T. COLT) (1879-). An actress born in Philadelphia. She attracted general attention in Clyde Fitch's *Captain Jinks* in 1900. She played in London in the title rôle of *Cynthia* in 1904, starred in *A Doll's House* in 1905, and in Barrie's *Alice-Sit-by-the-Fire* (1906), played the part of Mrs. Jones in *The Silver Box* in 1907, Zoë Blundell in *Mid-Channel* in 1910, and Stella Ballantyne in *The Witness for the Defense* in 1911. The following year she appeared in *The Twelve-Pound Look*, a satire by James M. Barrie, and *Cousin Kate*, and in 1913 in *Tante*, a comedy by C. Haddon Chambers (from a novel by Anne Douglas Sedgwick).

BARRYMORE, MAURICE (1847-1905). An actor and playwright, named Herbert Blythe. He was born in India and educated at Cambridge, England, but, having gone upon the stage, came to America in 1875, where he played with many of the best-known actors. The next year he was married to Georgiana Drew of the well-known actor family. His first season here was at Boston in *The Shaughraun*. In 1882 he became leading man for Madame Modjeska; in 1887, for Mrs. Langtry; in 1893, for Mrs. Bernard Beer; and the following season for Olga Nethersole. In 1899 he supported Mrs. Fiske, in *Becky Sharp*, playing very effectively the part of Rawdon Crawley. He wrote *Nadjeska*, which was produced by Madame Modjeska in 1884, and other plays. Consult Coward, in *Famous American Actors of To-day*, ed. McKay and Wingate

(New York, 1896), and Montrose J. Moses, *Famous Actor-Families in America* (New York, 1906).

BAR SHOT. A double-headed shot, in shape like a dumb-bell, consisting of a bar, with a half ball or round head at each end. Bar shot were formerly employed in naval warfare for the purpose of destroying masts and rigging.

BARSU'MA, or **BARSUMAS I** (?-c.489). A Nestorian (q.v.), who became Bishop of Nisibis and Metropolitan, 435. He induced the King of Persia to expel the Christians who followed the Greek fathers and to put Nestorians in their place (462). He founded the theological school at Nisibis, which sent missionaries to various countries. He married a nun (Mammæa) and maintained the right of all priests to marry. In Persia the Nestorians venerate him as the founder of their faith.

BAR-SUR-AUBE, bär'su'rôb' (Fr. Bar on the Aube). A town in the department of Aube, France, on the right bank of the river of that name, 34 miles by rail east of Troyes. It is an ill-built, ancient town, numerous old coins and urns attesting that the Romans must have had a station here. Bar-sur-Aube was destroyed by the Huns in the fifth century, but was rebuilt soon after, when it became a place of commercial importance. A chapel on the bridge which crosses the Aube marks the spot from which the Bastard of Bourbon was hurled into the river by command of Charles VII in 1441. Bar-sur-Aube is noteworthy as the place where the council of the allied sovereigns, which decided the plan of the campaign ending in the first fall of the Empire, was held on Feb. 25, 1814; and where, two days after, the French were defeated by the allies under the chief command of Schwarzenberg. The leading manufactures include leather, flour, and agricultural implements, and there is trade in wine, grain, and wool. Pop., 1896, 4548; 1901, 4339; 1906, 4507; 1911, 4533.

BAR-SUR-SEINE, sur-sân' (Fr. Bar on the Seine). An ancient town of France, in the department of Aube, pleasantly situated on the left bank of the Seine, 21 miles by rail south-east of Troyes (Map: France, N., K 4). The river is here crossed by a double bridge. The town possesses a small museum, and its most noteworthy building is the church of St. Etienne, dating from the sixteenth century. Bar-sur-Seine was fortified until the end of the fifteenth century and has been sacked several times. Pop., 1901, 3062; 1906, 3187; 1911, 3107.

BART, JEAN. See **BARTH**, JEAN.

BARTAS, bär'tä', GUILLAUME DE SALLUSTE DU (1544-90). A French Huguenot poet, diplomat, and soldier. He was born at Montfort and died from wounds received in the battle at Ivry. His *La création* (1578), a religious poem, was widely esteemed, passing through 30 editions in six years. He wrote also *Judith Urania*, *la seconde semaine de la création*, parts of which, as of *La création*, were translated by King James VI, Thomas Hudson, William Lisle, and Thomas Winter. Joshua Sylvester's version of *La création* (1598) was once very widely read in both England and America. The original has lines of fine inspiration emerging from a maze of dreary absurdity.

BARTELS, bär'têls, ADOLF (1862-). A German journalist and poet, born at Wesselsburen, in Holstein, and educated at Leipzig and Berlin. His poetic and dramatic works include:

Gedichte (1889); *Dichterleben* (1890); *Aus der meerumschlungenen Heimat* (1895); *Der dumme Teufel*, a mock epic (1896); and *Martin Luther*, a trilogy (1903), and some historical novels. His collected poems appeared in 1904. In the field of criticism and literary history he published *Friedrich Gessler* (1892); *Die deutsche Dichtung der Gegenwart* (1897); *Geschichte der deutschen Litteratur* (2 vols., 1901-02); *Adolf Stern* (1905); *Heinrich Heine* (1906); *Gerhart Hauptmann* (1906); *Deutscher Litteratur Einsichten und Aussichten* (1907); *Deutsches Schrifttum* (1911).

BARTENSTEIN, bär'ten-stîn. A town of East Prussia, situated on the Alle, 35 miles south of Königsberg (Map: German Empire, J 1). It possesses a gymnasium, several churches, a synagogue, an orphan asylum, a military school, and is the seat of a provincial court. There are manufactures of stoves and wagons, machine shops, iron foundries, breweries, and saw mills, and considerable trade in grain. Bartenstein is noted chiefly as the place where the treaty was concluded between the Prussians and the Russians on April 26, 1807. Pop., 1900, 6779; 1910, 7343.

BARTENSTEIN, bär'ten-stîn, JOHANN CHRISTOPH, BARON (1689-1767). An Austrian statesman, born at Strassburg. In 1727 he became Secretary of State under the Emperor Charles VI. He retained this position under Maria Theresa until Kaunitz was summoned to the Ministry of Foreign Affairs. His efforts to obtain European recognition of the Pragmatic Sanction of Charles VI proved unsuccessful, and his policy under Maria Theresa led to the humiliating treaties of peace negotiated at Breslau, Dresden, and Aix-la-Chapelle.

BAR'TER (OF. *barater*, *bareter*, to cheat). In commerce and political economy, the exchange of one commodity for another commodity, as contrasted with the sale of commodities for money. Among primitive peoples barter was doubtless the only method of exchange and is still pursued in trading with savage peoples. The trade of modern times, with its development of credit, is largely a system of barter in a modified form. This is seen most clearly in the exchanges between nations, where merchandise imports are balanced off against merchandise exports, and differences only liquidated by shipment of coin or bullion. The important difference between this modern barter and that of primitive peoples lies in the fact that money intervenes as a standard by which the commodities are measured, even though little money changes hands.

Barter in Law. Some courts have held that a statute which refers in terms to a sale of goods has no application to a barter of them, while other courts have held the opposite view. A power to an agent, or representative of the owner, to sell property is construed strictly, and hence the possessor of such a power, it is generally held, cannot barter the property. For most purposes, however, the rules governing sales are equally applicable to barter or exchange transactions. Indeed, courts of the highest authority have used barter and sale as inter-frequent chalybeate springs. Pop., 1901, 6102, mostly Slovaks.

BARTET, bär'tä', JEANNE JULIE REGNAULT (1854-). A French actress. She was born at Paris and studied at the Conservatoire (1871-72). She was then engaged at the Vaudeville,

and made her début in *L'Arlésienne*. She created the part of the Countess Zicka in Sardou's *Dora* (1877). Her first appearance at the Théâtre Français was as Mademoiselle Henderson in *Daniel Rochat* and before the end of the same year (1880) she was elected a member of the company. She has since appeared with success in *Ruy Blas*, *Iphigénie*, *Le roi s'amuse*, *L'Etrangère*, *Dénise*, *La souris*, *Thermidor*, *La paix du ménage*, *La loi de l'homme*, and *Grosse fortune*.

BARTFELD, bárt'fält (Hung. *Bártfa*). An ancient town of Hungary, in the county of Sáros, on the Tapola, about 28 miles north of Eperies (Map: Hungary, G 2). Its chief edifices are the fine thirteenth-century Gothic church of St. Egidius, and a handsome Rathaus dating from the fifteenth century. A statue of Empress Elizabeth was set up here in 1903. There is a considerable trade in linen. About 2 miles to the north of the town, in the midst of pine forests, are the celebrated and much-frequented chalybeate springs. Pop., 1901, 6102, mostly Slovaks.

BARTH, bárt. A seaport in Pomerania, Prussia, on the bay of the same name, 17 miles northwest of Stralsund (Map: German Empire, E 1). It has a good harbor, and among its institutions are a school of navigation and an establishment for single ladies of rank. It is the seat of a district court and has a church dating from the thirteenth century. Among its industries are shipbuilding, beer brewing, fish curing and packing, and the manufacture of sugar, leather, and cigars. It also has iron foundries, saw mills, and machine works. Pop., 1890, 5550; 1900, 7100; 1910, 7505.

BARTH, bárt, *Fr. pron.* bär, AUGUSTE (1834-). A French Orientalist. He was born at Strassburg, March 22, 1834. He is best known by his work in connection with the religions of India. His volume, *Les religions de l'Inde* (Paris, 1879), was translated into English by Wood (London, 1882). Mention may also be made of his *Inscriptions sanscrites recueillies au Cambodge* (Paris, 1885) and of numerous monographs and reviews in *Journal asiatique*, *Mélanges*, *Mémoires de la Société de Linguistique*, etc. His annual reports on researches into the history of Indian religions, in *Revue de l'histoire des religions* (1880), are especially valuable. He is a member of the French Institute.

BARTH, HEINRICH (1821-65). A German explorer and traveler. He was born at Hamburg and received his education at the University of Berlin. After visiting Italy and Sicily he embarked in 1845 at Marseilles and made excursions into Tunis, Tripoli, and Barca. He afterward extended his researches into Egypt, Sinai, Palestine, Asia Minor, and Greece, and in 1849 he published, at Berlin, *Wanderungen durch die Küstenländer des Mittelmeeres*. Late in that year he and Dr. Overweg again sailed from Marseilles as the scientific companions of James Richardson, intrusted by the British government with a political and commercial mission to Central Africa. Starting from Tripoli, the travelers crossed the Great Desert with much difficulty and danger. In January, 1851, they separated, and Dr. Barth pursued his researches, for the most part, by himself. In March of the same year Richardson, and in September, 1852, Overweg, having succumbed to the climate, Barth thenceforward was entirely alone. He, however, continued his explorations,

which, when he returned to Tripoli in September, 1855, had extended over 24° of latitude and 20° of longitude, from Tripoli in the north to Adamawa in the south, and from Baghirmi in the east to Timbuktu in the west—upward of 12,000 miles. The range of his investigations and the scientific manner in which he pursued them placed him in the front rank of African explorers. The result of his researches was given in his *Travels and Discoveries in North and Central Africa* (5 vols., 1857-58, published in both English and German). Afterward he made several journeys in Greece, Turkey, Asia Minor, and other countries on the Mediterranean. He also published *Reise von Trapezunt durch die nördliche Hälfte Kleinasien nach Skutari* (1860); *Sammlung und Bearbeitung zentral-afrikanischer vokabularien* (1862-66); *Reise quer durch das Innere der Europäischen Türkei* (1864).

BARTH, or **BART**, JEAN (1651-1702). A French naval hero. He was born at Dunkirk and at an early age entered the Dutch navy, but on the outbreak of war between France and Holland he passed over to the French service. As persons not of noble birth could not then obtain the rank of officer in the navy, he became captain of a privateer. In this capacity he displayed astonishing bravery, so that Louis XIV. dispatched him on a special mission to the Mediterranean. He became a terror to the Dutch navy and a serious menace to the commerce of Holland. On one occasion, with six vessels, he broke through a blockading fleet, shattered a number of the enemy's ships, and convoyed a transport of grain safely into Dunkirk harbor. His exploits overcame the disadvantages of his birth, and he was made lieutenant and soon after captain in the regular navy. In an action against a superior English force he was taken prisoner and carried to Plymouth, from which he made his escape in an open fishing boat to France. He cost the English and the Dutch merchants many millions, and their navies many ships. He was later ennobled by the King. Consult *Badin*, *Jean Bart* (Paris, 1867), and *Landelle*, *Jean Bart et son fils* (Paris, 1874).

BARTH, KARL HEINRICH (1847-). A German musician. He was born at Pillau, Prussia, and was a pupil of Von Bülow, Bronsart, and Tausig. He was long a member of the well-known trio, Barth, De Ahna, and Hausmann, whose chamber-music recitals were widely celebrated. In 1868 he was instructor in Stern's Conservatory, and since 1871 in the Königliche Hochschule in Berlin.

BARTH, PAUL (1858-). A German sociological writer. He was born at Baruthe in Silesia, Aug. 1, 1858. He is editor of the *Vierteljahrsschrift für wissenschaftliche Philosophie und Soziologie*, and a professor (*ausserordentlich*) in the University of Leipzig. He has written on philosophical subjects, but his *Philosophie der Geschichte als Sociologie*, the first volume of which appeared in 1897, is the best historical sketch of the development of sociological theory which has been published in Germany. Among Dr. Barth's other writings should be mentioned: *Geschichtsphilosophie Hegels und die Hegelianer bis auf Marx und Hartmann* (1890); *Tiberius Gracchus* (2d ed., 1893); *Beweggründen des sittlichen Handelns* (1899); *Erziehungs- und Unterrichtslehre* (1906); *Geschichte der Erziehung in Sociolo-*

gischer und geistesgeschichtlicher Beleuchtung (1911).

BARTH, THEODOR (1844-1909). A German journalist and politician, born in Duderstadt, and trained in the law at the universities of Heidelberg, Leipzig, and Berlin. He entered on the practice of his profession in Bremen in 1871, for four years was a magistrate in Bremerhaven, and after that served in the latter city until 1883 as secretary of the chamber of commerce. Having founded *Die Nation* in Berlin, he was its editor for 24 years, until it ceased publication in 1907. He joined the Liberal Union party, was elected to the Reichstag as member from Gotha in 1881, and later represented other districts up to 1898. Both in politics and as an editor he attracted much attention by his advocacy of the principles of free trade and by his opposition to the high protectionist policy of Bismarck and of the Junkers or Agrarian party. Not believing the Liberal Unionists sufficiently aggressive, he left them to join the *Deutsch-freisinnig* party in 1898 and in the same year became a member of the Prussian Landtag. From 1901 to 1903 he was again a member of the Reichstag, and in the latter year he even went so far as to unite with the Socialists in opposition to the reactionary forces in German politics. He made his last visit to the United States in 1907. His publications include: *Gegen den Staats-sozialismus* (1884); *Amerikanisches Wirtschaftsleben* (1887); *Amerikanische Eindrücke* (1896).

BARTHEL, bür'tel, MELCHIOR (1625-72). A German sculptor. He was born at Dresden, and studied with his father and with Johann Boehme, of Schneeberg (1640-45), and, after a long sojourn in Italy, including 17 years in Venice, settled at Dresden, where he was appointed sculptor to the court. His principal works are the colossal tomb of the Doge Giovanni Pesaro (Santa Maria dei Frari, Venice), the statue of John the Baptist (Oratory of Santa Maria, Nazareth), and a tomb in SS. Giovanni e Paolo, Venice. His numerous ivory carvings in the Green Vault at Dresden are considered superior to his more elaborate works, which are all in the manner of Bernini.

BARTHÉLEMY, bür'tá'l'-mé', ANTOINE. See PROUST, ANTONIN.

BARTHÉLEMY, AUGUSTE MARSEILLE (1796-1867). A French poet and politician. He was born at Marseilles, studied in the Jesuit College of Juilly, and came to Paris with some reputation as a poet after the Restoration. He speedily acquired fame as a satirist, and his light but stinging verse made all Paris laugh and many statesmen wince. The ministers of Charles X were especially his prey, and satirical epics named after them, *Les Sidiennes*, *La Villé-lade*, *La Corbiérède*, *La Peyronnéide*, followed each other in close succession. Imprisoned for expressing Napoleonic sentiments, he was liberated by the Revolution of July and turned at once to the support of Louis Philippe. With time his popularity waned, but he continued to pour out an endless stream of brilliant verse to the day almost of his death. His fine talents, however, were too often at the disposal of the highest bidder; and he sang Napoleon III as he did the Revolution of 1830. Of his serious work, *L'Insurrection* and *Napoléon en Egypte* deserve mention.

BARTHÉLEMY, FRANÇOIS, MARQUIS DE

(1747-1830). A French statesman. He was born at Aubagne, in the department of Bouches-du-Rhône, and after serving in the Bureau of Foreign Affairs under the Duc de Choiseul, acted as Secretary of Legation in Switzerland, Sweden, and England. The reputation he gained as negotiator of the treaties of Basel (q.v.) led to his being chosen one of the five directors in 1797. But his royalistic sympathies and his connection with the Clichians (a club of reactionaries) brought about his downfall on the 18th Fructidor (Sept. 4, 1797) and his transportation to Guiana. He escaped from there, returned to France after the 18th Brumaire (Nov. 9, 1799), and was made a senator by Napoleon, whom Barthélemy sedulously fawned upon till 1814, and then expeditiously deserted. Louis XVIII made him a Minister of State and a Marquis. In 1819 he proposed the restriction of the electoral franchise, a measure which was carried the following year. His position, however, had made him so unpopular that he was forced into retirement, where he remained until his death in 1830. Barthélemy was a man of considerable ability but slight political integrity. Consult Kaulek, *Papiers de Barthélemy* (Paris, 1887).

BARTHÉLEMY, JEAN JACQUES (1716-95). A French Hellenist and antiquarian, born at Cassis and remembered for his *Voyage du jeune Anacharsis* (1788), on which he labored 30 years. The voyage, or journey, of the Scythian Anacharsis involves an account of the customs, government, and antiquities of Greece, as they might have appeared to a classical traveler. The experiences of the youth are supplemented by dissertations on literature, music, economy, etc. The learning is not profound, but it is wide; the character of the supposed narrator is well sustained, and though now superseded, the work was immediately and immensely popular. It brought its author a seat in the Academy and such general regard that, though arrested during the Reign of Terror, he was immediately released by the Committee of Public Safety. He died in Paris, April 30, 1795. A modern attempt to imitate the *Anacharsis*, which was translated into English (1791) and many other languages, is the *Charicles* of Wilhelm Adolf Becker (q.v.), which has greater learning, but less charm.

BARTHÉLEMY SAINT-HILAIRE, bür'tá'l'-mé' sän' tē'lar', JULES (1805-95). A French Orientalist, classical scholar, and statesman, best known for his commentaries and translations of Aristotle (1837-70). He was born in Paris, and in early life played an active part in radical political journalism, but became in 1838 professor of Greek and Roman philosophy in the Collège de France. He took office during the Revolution of February, 1848, but retired for a time from public and professorial life after the coup d'état of Dec. 2, 1851. He was reconciled later to the Empire and resumed his professorship in 1862. From 1871 he was again active in politics—as deputy, senator for life (1876), and Minister of Foreign Affairs (1880-81). He died in Paris. His chief works, besides the Aristotelian translations and essays, are: *De l'école d'Alexandrie* (1845); *Rapport sur le concours ouvert pour la comparaison de la philosophie morale et politique de Platon et d'Aristote, avec les doctrines des plus grands philosophes modernes*

(1854); *Sur les Védas* (1854); *Du Bouddhisme* (1855); *Mahomet et le Coran* (1867); *La philosophie dans ses rapports avec les sciences et la religion* (1889); *Etude sur François Bacon* (1890).

BARTHEZ, bär'täs', or **BARTHES**, PAUL JOSEPH (1734-1806). A celebrated French physician. He studied medicine at Montpellier, became professor in the university in 1759, and acquired European renown as a practitioner and lecturer. In his principal work, *Nouveaux éléments de la science de l'homme* (1778), he set forth a new theory of life. According to this, there is in the living organism a *vital principle*, which should be distinguished, on the one hand, from the conscious and thinking mind; on the other, from the physical forces producing material transformations in the body. The life of each separate organ is but a *modus*, a particular manifestation of the "vital principle," and should not be regarded as a component part of the latter. Barthez was a keen thinker; he produced no experimental facts that might render his hypothesis immediately valuable to the biologist; yet his enlightened views had the effect of imparting a new and powerful impulse to the progress of science. He wrote also *Nouvelle mécanique des mouvements de l'homme et des animaux* (1798) and *Consultations de médecine* (1810).

BARTHOLD, bär'tölt, FRIEDRICH WILHELM (1799-1858). A German historian, born in Berlin. He studied theology and history at the universities of Berlin and Breslau and was appointed professor of history at Greifswald in 1831. His principal productions are the following: *Geschichte von Rugen und Pommern* (5 vols., 1839-45); *Geschichte der deutschen Städte und des deutschen Bürgertums* (4 vols., 1850-52); *Geschichte der deutschen Hansa* (3 vols., 1853-54); *Geschichte des grossen deutschen Kriegs vom Tode Gustav Adolfs ab* (3 vols., 1841-43).

BARTHOLDI, bär'töldé', FRÉDÉRIC AUGUSTE (1834-1904). A French sculptor. He was born at Colmar, Alsace, and at first studied painting under Ary Scheffer, but soon abandoned it for sculpture under Soitoux's influence, working thereafter by preference on a colossal scale and with architectural effects. Among his best-known works in this style are the colossal figure of "Liberty Enlightening the World," presented by France to the United States (1886; see LIBERTY, STATUE OF); a colossal group presented by France to Switzerland; the Lafayette Statue in New York (1873); and those of Lafayette and Washington in Paris (1892); and the "Lion of Belfort," an immense monument commemorating the defense of the place in the Franco-Prussian War. This last is generally considered his masterpiece.

BARTHOLDY, bär-töldé', JAKOB SALOMO (1779-1825). A Prussian diplomat. He was born in Berlin, of Jewish parentage, and was educated at the University of Halle. He fought in the Austrian army against Napoleon, afterward entered the diplomatic service of Prussia, and accompanied the Allied armies to Paris in 1814, whence he was dispatched to Rome in the following year as Prussian Consul-General. He was a great patron of the arts. The revival of fresco painting was due largely to his influence and example. His valuable collection of antiques was bought for the Berlin Museum of Art, while the frescoes of his mansion at Rome, the so-

called Casa Zuccari, were transferred in 1887 to the Berlin National Gallery.

BARTHOLIN, bär'tò-lèn. A family of Danish scholars, of whom the first to win distinction was KASPAR (1585-1629). He was successively professor of rhetoric, medicine, and theology at the University of Copenhagen and published in 1611 *Institutiones Anatomicae*, a text-book of anatomy used throughout Europe in the seventeenth century in German, English, French, and other translations. Of his sons, JAKOB (1623-53) was a distinguished Orientalist, and THOMAS (1616-80), a noted physician, naturalist, and philologist, who revised his father's *Anatomy* (1641) and was a warm defender of Harvey's doctrine of the circulation of the blood. Thomas had two sons, KASPAR (1655-1738), a distinguished anatomist, who discovered the function of the lymphatic glands and the sublingual duct and the seminal gland of the female; and THOMAS (1659-90), an antiquarian, author of *Antiquitatum Danicarum Libri Tres* (1689), a standard work. Consult J. Petersen, *Bartholinerne og Kredsens om dem* (1898).

BARTHOLIN'S GLANDS (named after Kaspar Bartholin, who discovered them). Two small, mucous glands, about the size of a pea, situated one on either side of the vagina. They are of the racemose type (see GLAND) and are the homologues of Cowper's glands in the male. They are of medical interest chiefly because they are prone to painful inflammation, as a result of gonorrheal infection, and occasionally become the seat of cysts.

BARTHOLOMÆ, bär-tò'lò-mä, CHRISTIAN (1855-). A German philologist and Iranian scholar. He was born at Bayreuth, June 21, 1855. After graduating from the Bayreuth Gymnasium in 1872, he studied classical philology and general philosophy at the universities of Munich, Leipzig, and Erlangen. He returned to Leipzig in 1874 to devote himself to comparative philology and Oriental studies. In 1879 he went to Halle as a member of the faculty and thence to an extra professorship at Münster, in Westphalia, in 1885. In 1898 he accepted a call to the professorial chair of Sanskrit and Indo-Germanic philology at Gießen. In 1909 he passed to the University of Heidelberg. Among his numerous and important contributions in the field of Aryan linguistics may be mentioned: *Das altiranische Verbum* (Munich, 1878); *Handbuch der altiranischen Dialekte* (Leipzig, 1883); *Arische Forschungen* (3 vols., Halle, 1882-87); *Studien zur indogermanischen Sprachgeschichte* (Halle, 1890-91); two important articles in Geiger and Kuhn's *Grundriss der iranischen Philologie* (Strassburg, 1895-96); an etymological dictionary of Avestan and Old Persian, *Altiranisches Wörterbuch* (Strassburg, 1904); *Die Gathas des Avesta* (1905); *Ueber ein Sassanides Rechtbuch* (1910).

BARTHOLOMÆUS ANGLICUS, ăng'li-kūs (Lat. *Anglicus*, English). An English scholar of the thirteenth century, erroneously styled DE GLANVILLE, author of the great mediæval encyclopædia, *De Proprietatibus Rerum*, "On the Nature of Things." He studied and taught theology at Paris and about 1230 entered the Minorite Order. His work was a source of common information on natural history and was translated into French in 1372, English in 1398, and Spanish and Dutch in the fifteenth century, and often printed. Consult *Histoire littéraire de la France*, vol. xxx (Paris, 1888).

BARTHOLOMÉ, bär'tô'lô'mä', PAUL ALBERT (1848-). One of the most prominent contemporary French sculptors. He was born at Thiverval (Seine et Oise) and studied law until the age of 23. He then took up painting under Menn in Geneva and Gérôme in Paris and from 1869 to 1876 was a successful painter of genre subjects. On the death of his wife in the latter year he retired to strict seclusion and devoted himself, without a teacher, to the mastery of sculpture. After a year he completed the beautiful monument to his wife in the village churchyard of Bouillant (Oise). He then began a monument designed to represent the grief of humanity for the dead, the complete model of which, under the name "Aux Morts," was exhibited in the Salon of 1895. At the joint expense of the state and the city of Paris it was carved in limestone and erected in 1899 at the entrance of Père Lachaise Cemetery. It is one of the most sublime achievements of modern sculpture. Into the portal of a pylon-shaped mausoleum enter the nude figures of man and wife, bewailed on either side by a passionate group of mourners; within a lower entrance, typifying the grave, presides the genius of death. Among the best of his other works are: a bronze "Weeping Child" (1894, Musée du Luxembourg); a series of beautiful female nudes, such as that adorning the fountain in the Musée des Arts Decoratifs, Paris, "The Secret" (Leipzig), and the "Girl Plaiting her Hair" (Albertinum, Dresden). He also carved many portrait busts and several very original grave monuments in various Paris cemeteries, and is represented by sculptures in the museums of Marseilles, Béziers, Brussels, Mühlhausen, Düsseldorf, and Dresden. Bartholomé is par excellence the sculptor of the nude in the attitude of grief. Consult Demaison, *M. Bartholomé et le monument Aux Morts* (Paris, 1900).

BARTHOLOMEW, EDWARD SHEFFIELD (1822-58). An American sculptor. He was born at Colchester, Conn., worked first as a bookbinder and a dentist, and studied a year in the Art Academy, New York. In 1845-48 he was curator of the Wadsworth Gallery, Hartford, Conn. When ready to go on farther with his studies, he found that he was color blind, and therefore he decided to devote himself to sculpture. On the point of his departure for Italy he was stricken with smallpox, his illness finally resulting in lameness for life. He later did go to Italy, and, with the exception of two visits to his native land, spent the remainder of his life there. His most important work, "Eve," together with his "Sappho" and "Genius of Connecticut," are in the Wadsworth Gallery, Hartford. Among his other works are "Ruth," "Naomi," "Morning Star" and "Evening Star," and "The Shepherd Boy of the Campagna." Bartholomew was a genuine artist, but was handicapped by inadequate training and continuous ill health.

BARTHOLOMEW, JOHN GEORGE (1860-). An English geographer and cartographer, born at Edinburgh, Scotland. He was educated at Edinburgh University, and in 1884 was one of the founders of the Royal Scottish Geographical Society. He introduced improvements in map making, especially notable being his layer system of contour coloring in topographical maps. His publications include: *Survey Atlas of Scotland* (1895-1912); *Citizen's Atlas* (1898-1912); *Survey Atlas of England*

and Wales (1903); *Atlas of World's Commerce* (1907); *Handy Reference Atlas of the World* (8th ed., 1909); *Atlas of Zoogeography* (1911).

BARTHOLOMEW, MASSACRE OF SAINT (Fr. *La Saint-Barthélemy*; shorter for *La Nuit de Saint-Barthélemy*, the night of St. Bartholomew). The massacre of the Huguenots, perpetrated on Aug. 24-25, 1572, which grew out of the feud in France between the house of Guise and the Catholics, on the one hand, and the house of Condé and the Huguenots on the other. (See CATHARINE DE' MEDICI.) From the tower of the royal palace the signal was given for a carnival of blood which lasted for several weeks and extended throughout France. The mortality cannot be determined with even approximate accuracy, as the different estimates, varying from 2000 to 100,000, show. Coligny, sought out by Guise himself, was among the first to fall. The two young Huguenot princes, Condé and Henry of Navarre, are said to have ransomed their lives by denying their religion. It is not likely, however, that this would have saved them, had not Catharine perceived that their death would have reacted against her by demoralizing the party opposed to Guise and leaving him with unlimited power—a thing she had no intention of permitting. Guise, although he had been the chief instrument in carrying out the plot, was unwilling to assume the ignominy attached to it, and Catharine induced her son to acknowledge before the Parlement his sole responsibility for the deed. The real part which the King took is hard to determine. Very reluctant at first to give his consent, he later, it is said, took a fiendish delight in the proceedings; but, on the other hand, some would have it that he died with remorse for the massacre. But whatever the other factors may have been, Catharine's imperative will and his own natural weakness leave little room for doubt as to the actual responsibility. The Pope ordered a medal to be struck in commemoration of the event and sent Cardinal Orsini to convey in person his felicitations to the Queen Mother.

For further reference, consult: White, *Massacre of St. Bartholomew* (London, 1868); Baird, *History of the Rise of the Huguenots of France* (New York, 1879-83); Baumgarten, *Vor der Bartholomäusnacht* (Strassburg, 1882); Lavissee, *Histoire de France*, vol. vi (Paris, 1904).

BARTHOLOMEW, SAINT (Gk. Βαρθολομαῖος, *Bartholomaios*, from Heb. *bar*, son + *Tolmai*). One of the Twelve Apostles, mentioned in each one of the four lists (Mark iii. 18; Matt. x. 3; Luke vi. 14; Acts i. 13) and generally identified with the Nathanael of the Fourth Gospel, on the ground that otherwise he would be the only disciple mentioned in the opening chapter of the latter Gospel who did not become an apostle, and the only one mentioned in its closing chapter who was not an apostle; while the close relationship shown in the first chapter to have existed between him and Philip would agree with the coupling of his name with Philip's in the lists of the Synoptists, by whom Nathanael is never mentioned, as Bartholomew is not by the Fourth Gospel. Bartholomew, which is a patronymic ('son of Tolmai'), would thus be a distinguishing name added to Nathanael, as Barjona ('son of Jona') was to Simon. In case, however, the identification be rejected, the name would be an independent proper name, like Barnabas. The traditions which assign him as a missionary to many countries and

make him to have suffered many martyrdoms are worthless. This disposes of the legend, which Eusebius repeats, that he preached the Gospel in "India" (properly Arabia) and left behind him there the Gospel of Matthew written in Hebrew—a story which has figured in the discussion of Papias' statement that Matthew wrote his Gospel in that language. (See MATTHEW, GOSPEL OF.) It was on his day in the Roman Calendar, August 24, that the massacre of the Huguenots in Paris took place in 1572. In the Syriac translation of Eusebius' History the name Tolmai (Bartholomew) is substituted for Matthias (I, xii. 3; II, i. 1; III, xxv. 6, xxix. 4), the apostle appointed by the Church in the place of Judas (Acts i. 23-26). In case this identification also be accepted, there would be in the final apostolic list two of the same name.

BARTHOLOMEW BAYOU, bi'ṭō. A river or bayou (q.v.) of the United States (Map: Arkansas, D 4). From its source in the southeastern part of Jefferson Co., Ark., it flows in a tortuous course southeast, then south, and, crossing into Louisiana, takes a southwesterly direction and empties into the Ouachita River in Ouachita Parish, La. It is about 275 miles long and is navigable for 200 miles.

BARTHOLOMEW FAIR. The great annual market, a relic of the Mediæval Ages, formerly held at West Smithfield, London. It dates from a charter of 1133 granted by Henry I to his jester, Rahere, who had turned monk and founded the priory of St. Bartholomew. The fair began annually on St. Bartholomew's Day (August 24, o.s.; September 3, n.s.), and lasted 14 days, but in 1691 was curtailed to four days and afterward to three days. It was abolished in 1855. Consult: Morley, *An Historical Account of Bartholomew Fair* (London, 1810); id., *Memoirs of Bartholomew Fair* (London, 1859).

BARTHOLOMEW'S (SAINT) HOSPITAL, Smithfield, London. Originally it formed part of the priory of St. Bartholomew, founded in 1123 by Rahere, the King's minstrel, who was the first prior of the convent of Augustinian Canons, founded by him in Smithfield. At the dissolution of the religious houses it was founded anew by Henry VIII, and the endowment has been subsequently enlarged from various sources, public and private. St. Bartholomew's is one of the three great endowed hospitals of London, the other two being St. Thomas's and Guy's. The hospital contains 675 beds and affords relief to 150,000 patients annually. There is a medical school attached, in which about 400 students are gathered; and a convalescent home accommodating 75 patients.

BARTHOLOU, bār'tō', LOUIS (1862-). A French statesman, born at Oloron-Sainte-Marie. He was educated at the Lycée de Pau. He early entered public life and occupied many important positions in the French government. He acted in several cabinets as Minister of Public Works, chief in the cabinet of the Ministry of the Interior, and Minister of the Interior. He was appointed Minister of Justice in the first cabinet organized by President Poincaré in 1913, under the premiership of Aristide Briand. On the fall of this ministry on March 18, 1913 (see FRANCE, History), he was appointed Premier and Minister of Public Instruction. This office he resigned in December of the same year. He published *L'action syndicale* (1904) and *The Life of Mirabeau* (1913).

BARTIZAN. A small stone closet, thrown out upon corbels over doorways and on other parts of mediæval castles, generally for defense, but sometimes only for convenience to the inmates and defenders. The word, probably a Scotch corruption of *bratticing* or *bretting*, was not used before Scott.

BARTLESVILLE. A city and the county-seat of Washington Co., Okla., about 125 miles (direct) from Oklahoma City, on the Atchison, Topeka, and Santa Fe and the Missouri, Kansas, and Texas railroads (Map: Oklahoma, F 1). It contains a Carnegie library, county courthouse, Elks Home, a fine city hall, and Silver Lake. Bartlesville is the centre of an important oil region known as the Mid-Continent Oil Field, which produces about 59,000 barrels a day. Washington County itself produces one-third of this amount. There are also zinc ore smelting interests and large deposits of natural gas. The commission form of government was adopted in 1910. Pop., 1900, 235; 1910, 6181.

BARTLET, J(AMES) VERNON (1863-). An English church historian, born at Scarborough. He was educated at Exeter College, Oxford, and after several years as fellow and lecturer he became professor of church history at Mansfield College, Oxford, in 1900. Besides his special contributions to reviews and works of reference, he is author of *Early Church History* (1894); *The Earlier Pauline Epistles* (1901); *The Apostolic Age* (1902); *Studies in the Synoptic Problem* (1911); *Evangelical Christianity* (1912).

BARTLETT, HOMER NEWTON (1845-1905). An American composer, organist, and teacher. He was born at Olive, N. Y., Dec. 28, 1845, and was one of the best known as well as most prolific of modern American musicians, his compositions and arrangements numbering nearly 200. He exhibited unusual precocity and in 1861 began his studies with S. B. Mills, Max Braun, Jacobson, and others. At the same time he commenced his career as a composer and subsequently held various positions in New York City and vicinity as organist, etc. Among his most popular compositions are a *concert polka* for pianoforte; an organ *toccata*; violin and orchestra *concerto*; tenor song, *L'amour*; and a cantata for chorus and orchestra, *The Last Chieftain*. He was particularly successful in his glees and part songs for men's and women's voices.

BARTLETT, JOHN (1820-1905). An American editor and publisher, born at Plymouth, Mass. He became senior member of the firm of Little, Brown & Co., Boston, in 1878. He compiled a well-known and valuable collection of quotations from poets and prose writers, entitled *Bartlett's Familiar Quotations* (1855), which has passed through many editions. He also published in 1894 an exhaustive concordance to Shakespeare.

BARTLETT, JOHN RUSSELL (1805-86). An American bibliographer, lexicographer, and ethnologist. He was born in Providence, R. I.; passed his early life at Kingston, Canada; became a banker in Providence, and later a bookseller in New York, and returned to Providence in 1850. From 1850 to 1853 he served on the commission appointed by President Taylor to fix the boundary between the United States and Mexico, in accordance with the Treaty of Guadalupe-Hidalgo, and from 1855 to 1872 was Secretary of State for Rhode Island. He was a

voluminous writer, among his publications being *The Progress of Ethnology* (1847); *A Dictionary of Americanisms* (1848), which went into many editions and was long a standard book of reference; *A Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora, and Chihuahua* (2 vols., 1854); and *Memoirs of Rhode Island Officers in the War of the Rebellion* (1867). In addition he compiled a number of valuable works, chiefly bibliographical, including *Records of the Colony of Rhode Island and the Providence Plantations* (10 vols., 1856-65); *Bibliography of Rhode Island* (1864); *Literature of the Rebellion: A Catalogue of Books and Pamphlets Relating to the Civil War and to Slavery* (1867), and a four-volume *Catalogue of the John Carter Brown Library*.

BARTLETT, JOSIAH (1729-95). An American statesman, born at Amesbury, Mass. After but slight study he began medical practice at Kingston, N. H., in 1750, and in 1754 successfully introduced Peruvian bark in treatment of *angina maligna*. From 1765 to 1775 he was a member of the State Legislature. In this capacity he frequently criticised the Governor, and it was to check his influence that he received from the royal Governor, Sir John Wentworth, appointments as a magistrate and as commander of a militia regiment, but in 1775 was deprived of both in consequence of his Whig activities. A delegate in 1775 and 1776 to the Continental Congress, he was the first member to vote for the Declaration of Independence, and the first, after the President, to sign the document. He became chief justice of the New Hampshire court of common pleas in 1779, a judge of the State Supreme Court in 1784, and chief justice in 1788. From 1790 to 1793 he was President of New Hampshire, and in the latter year, under the new constitution, was elected Governor. He was the principal founder (1791) of the New Hampshire Medical Society.

BARTLETT, PAUL WAYLAND (1865-). An eminent American sculptor. He was born at New Haven, Conn., the son of Truman H. Bartlett, sculptor and art critic. At 15 he began the study of sculpture in Boston under Frémiet, and afterward he studied with Cavellier in the Ecole des Beaux-Arts. He was at first interested in animal sculpture, his best work of this period being the "Dying Lion." Other examples are in the Jardin des Plantes, Paris. He received honorable mention at the Salon in 1887 for the "Bear Tamer," now in the Metropolitan Museum, New York. Among notable works of this sculptor are the "Ghost Dancer" (Pennsylvania Academy) and, in Fairmount Park, Philadelphia, an equestrian statue of General McClellan; the statue of Gen. Joseph Warren in Boston; the equestrian statue of Lafayette, presented by the school children of the United States to France, and now in the square of the Louvre, Paris; statues of Columbus and Michelangelo in the Congressional Library at Washington. Other works are in the public art collections of Philadelphia, Boston, and Chicago, and in the Luxembourg in Paris. Later productions than those already named include a door for the tomb of ex-Senator W. A. Clark in Woodlawn Cemetery, New York; a statue of Benjamin Franklin at Waterbury, Conn.; a marble group for the pediment of the House wing of the National Capitol, and six heroic figures for the central entrance of the New York Public Library. Upon the last

two commissions the sculptor was in 1913 still engaged. Bartlett's work for the most part represents a preference for the specific rather than the symbolic in sculpture. His highly modern technique is essentially French in character. He was chosen a corresponding member of the Institut de France and an officer of the Legion of Honor (1908). In 1913 he was appointed director of sculpture in the Glasgow School of Fine Arts.

BARTLETT, ROBERT ABRAM (1875-). An American explorer, born at Brigus, Conception Bay, Newfoundland, and educated at the Methodist College at St. John's and at the Halifax Nautical Academy. A qualified master of British ships, he accompanied Robert E. Peary on an Arctic expedition in 1897-98 and in 1905-09 commanded the *Roosevelt* in the voyages leading up to Peary's discovery of the North Pole. On the final dash he accompanied Peary on land as far north as the 88th parallel. Bartlett became a naturalized American citizen in 1911. Early in the summer of 1913 he sailed with the Stefansson Arctic expedition, in command of the Canadian vessel *Kartuk*; the object of the expedition was to explore the regions bordering on the North Pole and to define the limits of the new continent believed to exist there. In December of the same year Arctic mariners returned to Seattle with the news that Bartlett's ship had been carried far out into the Arctic Ocean during September and had not since been heard from.

BARTLETT, SAMUEL COLCORD (1817-98). An American clergyman and educator, born at Salisbury, N. H. He graduated at Dartmouth College in 1836 and at Andover Theological Seminary in 1842; was ordained to the ministry in 1843, and for the next three years was pastor of the Congregational Church of Monson, Mass. He was professor of intellectual philosophy at Western Reserve College (1846-52); pastor of the Franklin Street Congregational Church, Manchester, N. H. (1852-57) and of the New England Church, Chicago (1857-58); and was professor of biblical literature in the Chicago Theological Seminary (1858-77). From 1877 to 1892 he was president of Dartmouth College, which during his administration was greatly expanded as to curriculum, buildings, and funds. He received the degree of D.D. from Dartmouth and that of LL.D. from Dartmouth and Princeton. A distinguished biblical scholar, he published, in addition to contributions to the *Bibliotheca Sacra*, the *Princeton Review*, and other periodicals: *Life and Death Eternal* (1866); *From Egypt to Palestine* (1879); *Sources of History in the Pentateuch* (1883); *The Veracity of the Hexateuch* (1897).

BARTLETT, WILLARD (1846-). An American jurist, born at Uxbridge, Mass. He received his education at New York, and Columbia universities. He practiced law from 1869 to 1883, during part of this time acting also as dramatic critic of the *New York Sun*, was a justice of the Supreme Court of New York in the Second Judicial District from 1884 to 1906, and in the latter year became associate judge of the court of appeals. He was appointed professor of medical jurisprudence at the Long Island College Hospital in 1898. In 1913 he was elected chief judge of the court of appeals of New York State.

BARTLETT, WILLIAM FRANCIS (1840-76). An American soldier. He was born at Haverhill,

Mass., and studied at Harvard for three years, but left college in 1861 to join the Federal army. He received a captain's commission in August, served in the battle of Ball's Bluff, and at the siege of Yorktown received a wound which necessitated the amputation of his leg. By the spring of 1862 he had recovered sufficiently to graduate with his class at Harvard. He organized the Forty-ninth Massachusetts Volunteers in September, 1862, and served as colonel in General Banks's Louisiana expedition. He was wounded at Port Hudson and again in the Wilderness campaign, was taken prisoner at the explosion of the Petersburg mine, was confined for a time in Libby Prison, and after his release was placed in command of the First Division of the Ninth Army Corps. In June, 1864, he was raised to the rank of brigadier general of volunteers, and in March, 1865, was brevetted major general of volunteers for "gallant and meritorious services during the war." As a soldier he was noted for his intrepidity, coolness, and daring in action. After the war, until the time of his death, he was engaged in business in Richmond, Va., and Pittsfield, Mass. Consult Palfrey, *Memoir of William Francis Bartlett* (Boston, 1878).

BARTLETT, WILLIAM HENRY (1809-54). An English topographical draughtsman. He was born in London, and began his career as an assistant to John Britton, the architect, for whose *Cathedral Antiquities of England* (1814-32) he furnished numerous sketches. A series of volumes, containing more than 1000 of his drawings made during extended travel in Europe and the Orient, were published by Dr. Beattie, his companion on several of these voyages, and others. Between the years 1836 and 1852 Bartlett made four voyages to the United States and Canada, the fruits of which appeared in *American Scenery* (1840), and *Canadian Scenery* (1842), with text by N. P. Willis. Besides his frequent contributions to works of art, he published the well-known books: *Walks about Jerusalem* (1844); *Forty Days in the Desert* (1848); *The Nile Boat: or Glimpses of Egypt* (1849); *Footsteps of Our Lord and His Apostles in Syria, Greece, and Italy* (1851); *The Pilgrim Fathers* (1853); *Jerusalem Revisited* (1855).

BARTLETT, WILLIAM HOLMES CHAMBERS (1809-93). An American soldier and scientist, born in Lancaster Co., Pa., and educated at West Point, where he graduated in 1826. Being assigned to the engineers, he served as assistant professor at West Point from 1827 to 1829, and again from 1834 to 1836 as acting professor of natural and experimental philosophy. From 1828 to 1832 he was engaged in construction work at Fort Monroe, and from 1832 to 1834 was assistant to the chief engineer at Washington, D. C. In 1836 he resigned his lieutenantcy in the army and became full professor of natural philosophy at West Point, which office he held until he retired from active service in 1871. He was an original member of the National Academy of Sciences. His works include: *Treatise on Optics* (1839); *Synthetical Mechanics* (1850-58); *Acoustics and Optics* (1825-59); *Analytical Mechanics* (1853-59); *Spherical Astronomy* (1855-58).

BARTOL, CYRUS AUGUSTUS (1813-1900). A Unitarian minister, born at Freeport, Me. He graduated at Bowdoin College, 1832, and at the Cambridge Divinity School, 1835, and from 1837, for 50 years, was a pastor in Boston. His works include *Radical Problems* (1872), *The Ris-*

ing Faith (1875), and *Principles and Portraits* (1880).

BARTOLI, bär'tò-lè, ADOLFO (1833-94). An Italian scholar, born at Fivizzano. He at first studied law, but afterward became associate editor of the *Archivio storico italiano* (1856-59), principal of the gymnasium in Alessandria, director of the naval academies at Leghorn, principal of *licei* at Piacenza and Venice, and professor at the *Istituto degli studi superiori* at Florence (1874). While at Venice he was one of the founders of the periodical *Archivio Veneto* (1871-) and fostered the project of publishing the monumental *Diaries* of Marin Sanudo. Besides his valuable editions of the earlier Italian authors he published several original works, among which may be mentioned: *I viaggi di Marco Polo* (1859); *I primi due secoli della letteratura italiana* (1870-80); *I precursori del Boccaccio* (1876); *Storia della letteratura italiana*, vols. i-viii (1878-89), and *Scenari inediti della commedia dell' arte* (1880), all pioneer works in the modern school of historical criticism.

BARTOLI, DANIELO (1608-85). A learned Italian Jesuit. He was born at Ferrara and died at Rome. He was for many years rector of the Jesuit College at Rome, but is best known as author of an *Istoria dell Compagnia di Gesù* ('History of the Jesuits'), vols. i-iii covering the history of the order in Africa, China, and other parts of the East, and vols. iv-v, England and Italy. He also wrote numerous biographies, books on religion and morals, and on physical phenomena. His works have no longer any scientific or historical value, but they are highly interesting in style, wherein he is often compared with D'Annunzio. His book, *Il torto e il diritto del non si può*, is a distinct contribution to the theory of aesthetics. Consult Trabalza, *Storia della gramatica italiana* (Padova, 1907, chap. xi), Morandi, *Antologia della critica*, p. 627 (Città di Castello, 1895), and Boero, *Lettere edite ed inedite di D. B.* (Bologna, 1865). His complete works appeared at Turin (34 vols., 1823-44).

BARTOLINI, bär'tò-lè'nè, LORENZO (1777-1850). An Italian sculptor. He was born at Vernio, near Savigniana (Tuscany), the son of a smith. He labored at Florence as alabaster carver and went as such to Paris, where he studied under Lemot. With a bas-relief of "Cleobis and Biton" he obtained a prize at the Institute, which brought him commissions for a relief for the Vendôme Column and a bust of Napoleon for the Institute. In 1808 the Emperor sent him to Carrara to establish there a school of sculpture. Bartolini was, after Canova, the most celebrated of Italian sculptors of the Napoleonic era. After his patron's fall he was appointed professor of sculpture in the Florentine Academy. Although his work had hitherto been in the classical style of the First Empire, he now sought to reform this by the application of the realistic principles of the fifteenth-century Florentines. Their influence is evident in his later works, which thus form a transition from classicism to modern realism. Among the principal are the statues of "Charity," in the Pitti Palace, Macchiavelli in the portico of the Uffizi, and three important tombs in Santa Croce, Florence; "Neoptolemus Casting Atyanax from the Walls of Troy," the masterpiece of his classic period, and "Faith," often reproduced, now in the Poldi Pezzoli Museum,

Milan; two colossal statues of Napoleon, now at Bastia (Corsica) and in the United States, and many busts, including those of his friend Ingrès, Madame de Staël, Byron, Rossini, Cherubini, and Thiers.

BARTOLOMMEO, bär'tô-lôm-mä'ô, FRA (1472-1517). One of the principal painters of the Florentine Renaissance. The son of a mule driver from Genoa, he was born, March 14, 1472, near the gate of San Piero Gattolino, whence before becoming a friar, he was called Baccio (Bartolommeo) della Porta ('gate'). On the advice of Benedetto da Majano, who discovered his precious talent, he was placed in the atelier of Cosimo Roselli. There he came into contact with Piero di Cosimo, who, according to Berenson, was his master, and formed his lifelong friendship with Albertinelli (q.v.). With all the fervor of a pious nature he embraced the cause of Savonarola; of this devotion the well-known portrait of the reformer, long cherished by the brethren of San Marco, but now in the Academy, bears eloquent testimony. At the celebrated "Burning of Vanities" ordered by the Prophet, he destroyed all his pictures not of a strictly religious character. To the same period belongs his fresco of the "Last Judgment" (in Santa Maria Nuova, finished by Albertinelli, now in the Uffizi), when Bartolommeo entered the cloister. For after Savonarola's death he renounced painting and in 1500 joined the Dominicans at San Marco. Yielding to the persuasion of his prior, the learned Sante Pagnani, he took up the brush again in 1504, and created the beautiful "Apparition of the Virgin to St. Bernard" (Florentine Academy). He was much influenced by the works of Leonardo and by the young Raphael, whom he, in turn, influenced to a still greater degree. A visit to Venice in 1508 was epoch making for his art. The influence of Bellini and Giorgione transformed him into one of the chief colorists of the Florentine school. From 1509 to 1512 he was again associated with Albertinelli; among their joint works are the "Madonna and Saints" in the Pitti and the "Assumption" in Berlin, but the fine "Marriage of St. Catharine" in the Louvre is by Bartolommeo alone. On a brief visit to Rome (1514) his art was transformed by the Sistine frescoes of Michelangelo, whose colossal forms he thenceforth imitated. Like his friend Albertinelli, he was stricken with malaria, to which he finally succumbed at Pian di Mugnone, a convent house of the Dominican Order, Oct. 31, 1517. After his return to Florence occurred the well-known episode of his "St. Sebastian," the nudity of which proved so disturbing to the good brethren of San Marco as to cause its removal; it is now in private possession at Pézenas. The art of Fra Bartolommeo's early period may be best studied in his admirable drawings, of which a great number survive in the collection of prints of the Uffizi, the Louvre, Munich, British Museum, and that of Weimar. They show infinite diligence and a very remarkable talent for composition. Paintings of the early period are scarce; but an excellent example is the fresco of "Christ at Emmaus" (1507) in San Marco. The period following his visit to Venice is that of his finest paintings. Among the best are: "Madonna with Saints John and Stephen" (1509), and "Saints Mary Magdalen and Catherine Adoring God" (1509), both in the cathedral of Lucca; the "Madonna with Six Saints" (1509) in San Marco, Florence; the "Betrothal of St. Catharine"

ine" (1511) in the Louvre, and another in the Pitti Palace, both showing the influence of Leonardo in composition. Under the influence of Michelangelo his color deteriorated and the figures became empty of their former spiritual content; although the best are still masterpieces. They include the "Madonna della Misericordia" (1515) at Lucca, the well-known "St. Mark" (1517), "Salvator Mundi" (1514), and "Pietà," all in the Pitti Palace. He was the first to portray with highest excellence that majestic combination of character, form, and strict architectural composition so characteristic of the High Renaissance. He excelled especially in draperies and was among the first to use the lay figure, which he is said to have invented. He was one of the greatest masters of composition Italy ever produced. Although the color in his paintings has suffered much through his use of dark shadows, it is rich and delicate and belongs to the very best achieved by Florentine painters. Consult the biographies by Frantz (Regensburg, 1879), Scott (London, 1881), Gruyer (Paris, 1886), and Knapp (Halle, 1903).

BARTOLOZZI, bär'tô-lôt'sé, FRANCESCO (1727-1815). An Italian engraver, who practiced chiefly in England. He was born at Florence, the son of a goldsmith, and studied at the Florentine Academy, excelling especially in drawing and anatomy. Among his fellow pupils was his lifelong friend and future associate Giovanni Battista Cipriani (q.v.). After studying the antique at Rome he was apprenticed for six years to the engraver Wagner at Venice. He then practiced at Rome, engraving Domenichino's "Life of St. Nilus" and other seventeenth-century masters, and more successfully at Venice, where he formed a brilliant style well adapted to the rendition of seventeenth-century Venetian masters, especially Tiepolo. In 1764, on the invitation of Dalton, librarian to George III, he removed to London, where he was welcomed by Cipriani. He was appointed engraver to the King and was one of the original members of the Royal Academy in 1768. In Dalton's employ he completed a fine series of etchings of Guercino's drawings, probably his best etched work. He is especially known for his prolific work in the "red chalk manner of engraving," so called because of its resemblance to red chalk drawings, but in reality a kind of stippling (q.v.). Although he did not, as reputed, invent this process, he greatly improved it and made it so popular that it almost replaced other varieties of engraving in Great Britain. In this manner he reproduced many paintings, mostly classical subjects by Angelica Kauffmann and his friend Cipriani, and also engraved his celebrated *Imitations of the Original Drawings by Hans Holbein in the Collection of His Majesty*, 1792, which were tinted as well as stippled. Of greater importance are his line engravings, such as "Clytie," after Annibale Carracci, Carlo Dolci's "Mater Dolorosa," and a number of plates for Boydell's Shakespeare. In 1802 Bartolozzi was made head of the Royal Academy at Lisbon, where he remained in charge of the school of engraving until his death. He was an artist of great facility and diligence, but his work was often superficial, owing to its great volume and the frequent assistance of pupils. But in his best work he is an engraver of high order, whose prints are still much prized. He formed a large and important school in London, which continued his work after his departure. Con-

sult Tuer, *Bartolozzi and his Works* (London, 1882); Brinton, *Bartolozzi and his Pupils in England* (ib., 1904); "Bartolozzi and Other Stipple Engravers" in *Great Engravers Series* (ib., 1906); Bailly, *Bartolozzi* (ib., 1907).

BARTOLUS, Osso, or **BARTOLUS A SAX-OFERRATO** (1314-57). A celebrated Italian jurist, professor of civil law in the University of Perugia, and the most famous master of the dialectical school of jurists, the Postglossators, also called, after him, the Bartolists. His influence on the progress of legal science was considerable, and he won great reputation by his lectures and writings; among the latter are treatises *On Procedure* and *On Evidence* and a *Commentary on the Code of Justinian* (1588-89). His magnificent monument in the church of San Francisco at Perugia bears simply his name. His complete works were published in 1596. Consult John Neville Figgis, *Bartolus and the Development of European Political Ideas* (London, 1905).

BARTON, bār'ton, ANDREW (?-1511). A Scottish naval commander, who in 1506 completely cleared the coast of Scotland of the Flemish pirates who had infested it. He is said, on this occasion, to have packed the heads of the slain in three barrels, which he sent to King James in evidence of the effectual manner with which he had executed his task. In 1508 he was sent to the assistance of Denmark in the war with Lübeck, but somewhat later was accused of piracy, and after a desperate naval battle was killed in an encounter with Sir Thomas and Sir Edward Howard, who had been sent out by Henry VIII to capture him. His ship, *The Lion*, was brought as a trophy to the Thames, and became the second man-of-war in the English navy; the first vessel of this kind to be constructed having been the *Great Harry* (1504). The defeat of the celebrated mariner is commemorated in the old ballad of "Sir Andrew Barton."

BARTON, BENJAMIN SMITH (1766-1815). An American naturalist. He was born at Lancaster, Pa.; studied at Philadelphia, London, Edinburgh, and Göttingen, and was professor of natural history, botany, and materia medica in Philadelphia College, now the University of Pennsylvania. Besides many papers in the philosophical and medical journals, he published *Observation on Some Parts of Natural History* (1787), *New Views of the Origin of the Tribes of America* (1797), *Elements of Botany* (1803), *Collections toward a Materia Medica of the United States* (1819), and other medical works.

BARTON, BERNARD (1784-1849). An English poet, sometimes called "the Quaker Poet." He was born at Carlisle, Jan. 31, 1784. In 1810 he became clerk to a banking house at Woodbridge, where he remained till his death. His first volume of verse, *Metrical Effusions* (1812), brought him into correspondence with Southey. *Poems by an Amateur* (1818) and *Poems* (1820) increased his reputation and gained him the friendship of Lamb. *Napoleon and Other Poems* appeared in 1822 and was followed within five years by several other productions. All the poems of Barton are pervaded by pious sentiment, and some passages display much natural tenderness and religious fervor; but he is, on the whole, rather a fluent, pleasant versifier than a poet. Some years before his death he received, through Sir Robert Peel, what was at that time regarded in England as a large

pension, of £100. Among his later works are *Fisher's Juvenile Scrap-book* (1836 ff.), *The Reliquary* (1836), and *Household Verses* (1845). He died Feb. 19, 1849. Consult Barton, *Poems and Letters*, ed. L. Barton, with a memoir by E. FitzGerald (London, 1849), and Lucas, *Bernard Barton and his Friends* (London, 1894).

BARTON, CLARA (1821-1912). An American philanthropist. She was born at Oxford, Mass., was a teacher in early life, and the founder of various free schools in New Jersey. In 1854 she had a clerkship in Washington, but resigned at the beginning of the Civil War and went into hospital service. After the war she originated and carried on, at her own cost, a systematic search for missing soldiers. Going to Europe, she assisted in establishing hospitals in the Franco-German War, followed the German army, and was honored with the Gold Cross of Baden and the Iron Cross of Germany. By her efforts the American Red Cross Society was formed, 1881, and she was its president until 1904. In 1905 she became president of the National First Aid Association. In 1883 she was appointed superintendent and steward of the reformatory prison for women at Sherborn, Mass. In 1884 she represented the United States at the Red Cross Conference and at the International Peace Convention in Geneva. It was her suggestion that led to a change of the rules of the Red Cross Society permitting relief in other calamities than that of war. She superintended relief work in the yellow fever pestilence in Florida (1887), the Johnstown flood (1889), the Russian famine (1891), among the Armenians (1896), in the Spanish-American War (1898), and in the Anglo-Boer War (1899-1902). The last work of which she took personal direction was the relief of sufferers from the flood at Galveston in 1900. She wrote a *History of the Red Cross* (1883), *History of the Red Cross in Peace and War* (1898), *Story of the Red Cross* (1904), *Story of my Childhood* (1907). Consult Adams and Foster, "Clara Barton," in *Heroines of Modern Progress* (1913).

BARTON, SIR EDMUND (1849-). An Australian statesman. He was born at Glebe, a suburb of Sydney, New South Wales, studied law, and was called to the bar in 1871. He was long a leading figure in the legislative council and assembly and was Speaker and Attorney-General. He was a member of the Federal Convention of 1891 and was senior representative for New South Wales at the Convention of 1897-98. Upon the creation of the Australian Commonwealth, for which he had ardently labored, he became Prime Minister and Minister for Foreign Affairs in the first Federal cabinet (1901), retiring in 1903 to become a member of the Federal High Court.

BARTON, ELIZABETH (1500?-34). An English impostor, commonly known as the "Holy Maid," or "Nun of Kent." She was born, according to her statement, in 1506. About 1525 she was employed as a tavern servant at Aldington, where she developed religious mania after a severe nervous illness. In prolonged trances she "told wondrously things done in other places, whilst she was neither herself present nor yet heard no report thereof." The fame of these revelations spread, and Archbishop Warham sent two monks to examine her. One of these, Edward Bocking, or Bocking, saw in her abnormal faculties an opportunity for increasing the pres-

tige of the Roman Catholic religion. He influenced and instructed her, and by assumed "prophecies" she deceived persons of all ranks and men of intellect. In 1527 she became a nun at Canterbury and in 1532 inveighed against Henry VIII's intention to divorce Queen Catharine, predicting his death within a month of his remarriage. This excited the King's wrath, and she lost popular confidence by the non-fulfillment of her prophecy. She was arrested and ultimately confessed that her visions and sayings were "feigned of her own imagination only, to satisfy the minds of those which resorted to her and to obtain worldly praise." With Bocking she was executed at Tyburn, April 20, 1534. Consult Froude, *History of England*.

BARTON, GEORGE AARON (1859-). An American clergyman and Orientalist, born at East Farnham, province of Quebec. He was educated at Haverford College and Harvard University. He became a minister of the Society of Friends in 1879, professor of Biblical literature and Semitic languages at Bryn Mawr College in 1891, and in 1902 director of the American School for Oriental Study and Research in Palestine. Among his publications are: *A Sketch of Semitic Origins, Social and Religious* (1902); *The Haverford Library Collection of Cuneiform Tablets, or Documents from the Temple Archives of Telloh* (2 parts, 1905-09); *The Heart of the Christian Message* (1910; new ed. revised, 1912); "Commentary on Job" in the *Bible for the Home and School* (1911).

BARTON, WILLIAM (1748-1831). An American soldier, born in Rhode Island. On the night of July 9, 1777, he led a small party across Narragansett Bay, eluded three British war vessels, and near Newport captured the English General Prescott. For this act Congress gave him a sword and a colonel's commission.

BARTON, WILLIAM ELEAZAR (1861-). An American clergyman and writer, born at Sublette, Ill. He graduated from Berea College in 1885, and from Oberlin Theological Seminary in 1890. Ordained to the Congregational ministry, he first filled several pastorates in Ohio and Tennessee, then served the Shawmut Congregational Church of Boston in 1893-99, and afterward the First Church of Oak Park, Ill. The Chicago Theological Seminary appointed him in 1905 lecturer on applied practical theology, and in 1911 lecturer on ecclesiastical law. He was also associate editor of *Bibliotheca Sacra*, editor of the pastor's department of *The Advance*, and a member of *The Youth's Companion* staff. A full list of his books would comprise over 40 titles. Among these are: *Life in the Hills of Kentucky* (1889); *A Hero in Homespun* (1897); *The Psalms and their Story* (1898); *The Old World in the New Century* (1902); *Jesus, His Life and the Scenes of His Ministry* (1904); *The History and the Religion of the Samaritans* (1906); *Bible Classics* (1911); *The Young Folks' Bible Library* (editor, 8 vols., 1911); *Day by Day with Jesus* (1913).

BARTON, WILLIAM PAUL CRILLON (1786-1856). An American botanist. He was born in Pennsylvania, graduated at Princeton in 1805, and received the degree of M.D. from the University of Pennsylvania (1808). He organized the United States naval bureau of medicine and surgery, succeeded his uncle as professor of botany in the University of Pennsylvania,

was for several years professor of materia medica and botany in Jefferson Medical College, and at his death was senior surgeon of the navy. He published *Vegetable Materia Medica of the United States* (1817-25); *Compendium Florae Philadelphiae* (2 vols., 1818); *Flora of North America* (3 vols., 1821-23).

BARTOW, bär'tó. A city and the county-seat of Polk Co., Fla., 43 miles by rail east of Tampa, on the Atlantic Coast Line and the Seaboard Air Line railroads (Map: Florida, E 4). It is the seat of the Summerlin Institute, and contains a Carnegie library, county jail, opera house, and a fine county courthouse. The leading industries are phosphate production and fruit cultivation, and there are marble works, a planing and shingle mill, cigar, wagon, and concrete factories, and bottling works. The electric light plant and water works are owned by the city. Pop., 1890, 1386; 1900, 1983; 1910, 2662.

BARTRAM, JOHN (1699-1777). The first American botanist of eminence. He was born of Quaker parentage, near Darby, Pa. He secured an appointment as American botanist to George III, and Linnaeus, with whom he corresponded, pronounced him "the greatest natural botanist in the world." For many years he carried on an extensive correspondence with the most eminent of European naturalists, to whom he sent large plant collections in exchange for books, and at his home near Philadelphia he received as his guests many foreigners attracted thither by his reputation for learning and hospitality. In 1728 he established at Kingsessing, on the Schuylkill, the first botanical garden in America. In addition to several papers which he contributed to the *Transactions of the Philosophical Society*, he wrote a small but very interesting book, entitled *Observations on the Inhabitants, Soil, Divers Productions, Animals, etc., Made by John Bartram in His Travels from Pennsylvania to Onondaga, Oswego, and the Lake Ontario* (1751). His *Journal Kept Upon a Journey from Saint Augustine up the Saint Johns* was published in William Stork's *Description of East Florida* (1769). Consult William Darlington, *Memorials of John Bartram and Humphrey Marshall* (Philadelphia, 1849).

BARTRAM, WILLIAM (1739-1823). An American botanist and ornithologist. Son of John Bartram. He was born at Kingsessing, Pa., Feb. 9, 1739, and died there, July 22, 1823. He prepared the most complete list of American birds before Alexander Wilson and wrote *Travels through North and South Carolina, Georgia, and East and West Florida* (Philadelphia, 1791).

BARTSCH, bär'tsh, ADAM VON (1757-1821). An eminent Austrian engraver and writer on art. He was born in Vienna, where he studied engraving under Schmutzer and was appointed custodian of the Imperial collection of engravings. He practiced both as an engraver and an etcher and produced 505 plates, partly of his own invention, partly after the original designs of famous masters. His chief title to fame consists in the authorship of *Le Peintre-graveur* (21 vols., 1802-21; new ed., 1866-70), a critical catalogue of engravings of still undisputed authority. In this work he laid the foundations of the modern science of engraving. Of great importance also are the reproductions of Dürer's engravings, executed by him and under his direction and published at Vienna (1796-99).

BARTSCH, KARL FRIEDRICH ADOLF KONRAD (1832-88). A German philologist. He was born at Sprottau, Silesia, Feb. 25, 1832. From 1858 to 1871 he was professor at Rostock, where he established the first Germanic Seminary in Germany. From 1871 until his death he was head of the department of German and Romance philology at the University of Heidelberg. In 1868 he succeeded Pfeiffer as editor of *Germania*. As a scholar, Bartsch was distinguished by versatility and industry. His attention was divided between Middle High German and Provençal poetry, in both of which he edited numerous texts, accompanied by exhaustive investigations of metre, literary relations, etc. Probably his most important single contribution is his study of the *Nibelungenlied* (1865), which was followed by several editions of the poem and a translation into modern German (1867). His study of the early literatures of Germany and France enabled him to discover many important connections between the two. Among his many other works may be mentioned introductions to the study of Old French and Provençal; *The Song of Roland* (1874); a translation of Burns (1865), of Dante's *Divine Comedy* (1867), and of old French folk songs (1882). Bartsch's latest work was the preparation of a catalogue of the Old German MSS. of the University Library in Heidelberg (1886). Bartsch was an original poet as well as a scholar and in 1874 published a volume of lyrics. While much of his work is now antiquated, he will always be remembered as one of the most brilliant scholars and teachers that Germany has ever possessed. For biography, bibliography, and criticism, consult *Germania*, vol. xxxiii (1888).

BARTELOT, bârtlô', EDMUND MUSGRAVE (1859-88). An English officer. He served in the Indian army and participated in the Afghan campaign and afterward received an appointment as major in the Egyptian army, in which capacity he joined the Stanley Expedition of 1887 for the relief of Emin Pasha. On June 11, 1888, after vainly waiting for the carriers promised by Tippoo Tib and notwithstanding the sickness and famine in his camp, Bartelot began his journey into the interior. In a mutiny among his followers, within a week of his departure, he was shot by one of his men. The accusation of barbarous cruelty, afterward brought against him by Stanley, was refuted by Bartelot's brother, Maj. Walter G. B. Bartelot, in the volume entitled *The Life of Edmund Musgrave Barttelot* (London, 1890).

BARU, bâ-rôo' (Malay). See GOMUTI.

BARUCH, bâ-rûk (Heb. the blessed; cf. *Benedict*). The son of Neriah, and member of an illustrious family (cf. Jer. li. 59). He was the person to whom the prophet Jeremiah dictated some of his oracles (Jer. xxxvi. 4 seq.), and who also read Jeremiah's prophecies before the people who were present in the chamber of Gemariah in the Temple (ib., xxxvi. 10). During the siege of Jerusalem by Nebuchadnezzar, both he and the prophet were by their own countrymen imprisoned on suspicion of aiding the Chaldeans (Jer. xxxvii. 13; xliii. 3; Josephus, *Ant.* x, 9, 1), but obtained from the conqueror freedom and permission to choose their own residence. Baruch remained for some time in Palestine; but when the people, in spite of Jeremiah's remonstrances, went down to Egypt, the prophet, as well as Baruch, accom-

panied them (Jer. xliii. 6; Josephus, *Ant.* x, 9, 6). His subsequent history is unknown.

BARUCH, BOOKS OF. There are several works claiming to come from the pen of Jeremiah's secretary, mentioned in Jer. xxxvi. 4 ff.; xlv. 1. The most important among them are:

1. *The Book of Baruch*, which has a place in the Greek Bible between Jeremiah and Lamentations. This is one of the deuterocanonical books counted by the Protestants and the Greek Orthodox church in Russia as apocryphal. Besides the Greek text found in Codd. Vaticanus, Alexandrinus, Marchalianus, Venetus, and at least 20 minuseles, we possess Syriac, Old Latin, Coptic, Ethiopic, Arabic, and Armenian versions. The original was written in Hebrew. Origen supplied it throughout with asterisks and obeli according to the Hexaplaric Syriac. (See BIBLE.) Codex Ambrosianus of the Syriac text has in some places the remark "This is not in the Hebrew" (i. 17; ii. 3). After an introduction (i. 114) describing the origin and purpose of the book, the first part (i. 19-iii. 8) consists of a confession of the sins of the people which led to the captivity and a prayer for the restoration of national independence; the second part (iii. 9-iv. 4) contains a eulogy of wisdom, synonymous with the law, in the style of Proverbs viii and the later "wisdom" literature; and the third part (iv. 5-v. 9) offers consolation to the exiles. Some scholars hold that these sections come from different hands, but there is not enough evidence to make the documentary analysis convincing. According to i. 2 Baruch wrote the book in the fifth year, by which probably 581 B.C. is meant, the fifth year from the capture of Jerusalem by Nabuzaradan. An appendix to the Book of Jeremiah, drawn apparently from an old and reliable source, informs us (Jer. lii. 30) that there was a second deportation of exiles in 581. This seems to be the occasion the author of the Book of Baruch has in mind. He assumes that the final destruction of Jerusalem took place then, and that Baruch was carried away to Babylon, where he read the words of the book to Jehoiakim and the nobles, with the effect that a collection was taken and sent to Joachim, the high priest, together with the temple vessels that were returned, and a counsel to the people of Jerusalem to offer sacrifices on the altar there and to pray for Nebuchadnezzar and his son. But this exhortation to pray "for the life of Nebuchadnezzar and for the life of his son Balthasar" (i. 12) clearly shows that Baruch cannot have written the book. Balthasar is the Aramaic form of Belshazzar (Dan. v. 1), who is undoubtedly identical with Bilsharusur, the son of Nabuna'id, the last native King of Babylon, and not of Nebuchadnezzar. (See BELSHAZZAR.) Baruch would also have written this king's name Nebuchadrezzar, and not Nebuchadnezzar, as was done in later times. The influence of the Book of Daniel, or at least the legend which meets us for the first time in this book, written in 165 B.C., is manifest, as is that of Isaiah xl-lv. and Job (see ISAIAH and JOB). If a date subsequent to 165 B.C. is therefore probable, it is not necessary to suppose that Baruch iv., v. are quotations from the Psalter of Solomon (c.48 B.C.), as the Psalmist may have quoted Baruch. Many scholars maintain that the reference to Nebuchadnezzar and Balthasar is an evidence that the author had in mind Vespasian and his son Titus and would place the composition of the book after 70 A.D.

But if it is assumed that the author reflects upon the historic situation at his own time and counsels exiled Jews to send gifts to Jerusalem, to offer sacrifices upon the altar there, and to pray for the Roman emperors, it is difficult to render such advice plausible in the circumstances following the fall of the city in 70 A.D. It seems more probable that he lived in the second century B.C., and simply placed himself back, with more or less success, into the historic situation of Baruch, expressing the feelings that would be natural to him. Consult Reusch, *Erklärung des Buches Baruch* (1853); Ewald, *Die Propheten des alten Bundes* (1868); Kneucker, *Das Buch Baruch* (1879); Gifford, in *Speaker's Commentary* (1888); Cornely, *Introductio in V. T. Sacros libros*, ii. 2 (1897); Marshall, in Hastings, *Dictionary of the Bible* (1898); Bevan, in Cheyne's *Encyclopædia Biblica* (1890); Rothstein, in Kautzsch, *Pseudepigraphen d. A. T.* (1900); Toy, in *The Jewish Encyclopædia* (1902); Schneedorfer, *Das Buch Jeremias, des Propheten Klaglieder, und das Buch Baruch* (1903); Whitehouse, in Charles, *Apocrypha and Pseudepigrapha of the Old Testament*, vol. i (1913).

2. *The Syriac Apocalypse of Baruch.* An apocryphal book extant as a whole only in a Syriac text. Chapters lxxviii-lxxvi were already printed in the Paris Polyglot (1629-45); the rest of the work was not known until Ceriani published a Latin translation in 1866, and then the Syriac text in Codex Ambrosianus in 1871, and, in photolithographic reproduction, in 1883. A fragment of the Greek version was published by Grenfell and Hunt in *The Oxyrhynchus Papyri*, iii. (1903). It was probably written originally in Hebrew, as Charles and Wellhausen have shown, and then translated into Greek, from which our Syriac text is a version. The book claims to contain revelations that came to Baruch in the twenty-fifth year of Jeconiah, by which this king's lifetime is evidently meant, consequently in 589, and also after the destruction of the city. Baruch, however, cannot have written this book; for the author is aware of a later destruction of Zion (xxxii. 3), forgets that Baruch was still in the land (lxxv. 2 f.), is familiar with the doctrines of a heavenly Jerusalem (iv. 2 ff.), a Gehenna (lxxv. 13), a Messiah (xxix. 3; xxx. 1 ff.; xxxix. 7; lxxii. 2), and a resurrection from the dead (xlix.-li.), and reveals in other ways that he lived in a later time. His doctrinal attitude is that of the Pharisaic party, and salvation through obedience to the law is strongly emphasized; but there is no evidence of acquaintance with the teachings of Paul or conscious polemics against them. The author seems to be familiar with Daniel and Enoch i.-xxxvi., but it cannot be shown that he had before him the Apocalypse of Ezra. (See EZRA, BOOKS OF.) He probably wrote between 70 and 90 A.D. Kabisch, De Faye, and Charles have been struck with the sad tone that prevails in some sections and the cheerful look into the future that characterizes others and have assigned these to different authors. Charles has also noticed the absence of references to the Messiah, the resurrection, or the restoration of Israel, where he would expect it, and has suggested that there were at least seven authors living at different times before and after 70 A.D. whose works were drawn upon in the compilation of this apocalypse. These arguments, how-

ever, do not appear valid to all scholars. That an author living after the terrible experience of 70 A.D., writing in the name of one who had seen the destruction of Jerusalem in 586 B.C., should lament, sing elegies and look with anxiety for the signs of the time, is not extraordinary and is not to be ascribed to pessimism; nor is it inconsistent in the same man to rise to fervid hopes for the future, and the argument from silence is especially precarious in a case like this. The Epistle to the Nine and a Half Tribes (lxxviii.-lxxvi.) has the appearance of being a later addition; the Epistle to the Exiles in Babylon referred to in lxxvii. 12, 17, 19 may once have formed a part of the book, though now lost; and there are probably some interpolations. But in the main the book is likely to be the work of one author. In the visions and the prophecies as well as in the laments there are many passages that show true poetic inspiration. Consult: Ceriani, *Monumenta sacra et profana*, v. ii (1866); Langen, *De Apocalypsi Baruch* (1867); Hilgenfeld, *Messias Judæorum* (1869); Rosenthal, *Vier apocryphische Bücher* (1885); Kabisch, in *Jahrbücher für protestantische Theologie* (1891); De Faye, *Les Apocalypses juives* (1892); Ginzberg, in *The Jewish Encyclopædia* (1902); Wellhausen, *Skizzen und Vorarbeiten*, vi (1899); Ryssel, in Kautzsch, *Apokryphen und Pseudepigraphen des A. T.* (1900); Charles, *Apocalypse of Baruch* (1896); id., in *Apocrypha and Pseudepigrapha of the Old Testament* (1913).

3. *The Greek Apocalypse of Baruch.* An apocryphal book referred to by Origen (*De Principiis*, ii. 3. 6), discovered by Butler in the British Museum in 1896, and published by James in 1897. A shorter Slavonic version had already been published by Novakovic in 1886. Both the Greek and the Slavonic manuscripts come from the sixteenth century. It claims to be a revelation given to Baruch when he sat weeping over the captivity of Jerusalem near the beautiful gates where the Holy of Holies lay. He is said to have been carried by the angel Phanuel through the heavens on a 185 days' journey. Originally there was probably an account of all the seven heavens, referred to in Testaments of the Twelve Patriarchs, Slavonic Enoch, and Ascension of Isaiah. The Slavonic version mentions only two heavens. Of special interest is the description of the bird Phœnix which may show Indian influence, as well as the rôle assigned to the angel Michael as the mediator between God and men and the holder of "the keys of the kingdom of heaven." The author seems to be acquainted with Slavonic Enoch, written in the second half of the first century A.D., and probably wrote in Greek. There is a long Christian interpolation in chap. iv., occasioned by the remark in the text that the fruit of the vine caused the fall of Adam, and intended to reconcile the harmfulness of wine with its use in the Eucharist, and also a quotation from Matt. xxv. 20 in xv. 4. In all probability the book was written toward the end of the second century A.D. Consult: Stojan Novakovic, in *Starine*, vol. xviii (1886); Bonwetsch, in *Nachrichten der K. Gesellschaft der Wissenschaften zu Göttingen* (1896); James, in *Texts and Studies*, vol. v (Cambridge, 1897), giving the Greek text; Morfill, ib., giving an English translation of the Slavonic text; Ryssel, in Kautzsch, *Apokryphen und Pseudepigraphen d. A. T.* (1900); Ginzberg,

in the *Jewish Encyclopædia* (1902); Hughes, in Charles, *Apocrypha and Pseudepigrapha of the Old Testament* (1913).

4. *The Rest of the Words of Baruch*. An apocryphal book of which the Greek text was first published in *Menæum Græcorum* (Venice, 1609), then by Ceriani, *Monumenta sacra et profana*, v, i (1868) under the title "Paralipomena Jeremiæ prophetæ," and finally by Rendel Harris in 1889, the Armenian version in a collection of *Uncanonical Books of the Old Testament*, vol. i (Venice, 1896), and the Ethiopic version by Dillmann in 1866 as *Reliquæ Verba Baruchi*. It tells of the concealment of the sacred vessels by Jeremiah, his deportation to Babylon, and Baruch's stay in Jerusalem; how before the fall of the city Abimelech (Ebedmelech, Jer. xxxviii. 7 ff.) was sent to Agrippa's vineyard to get figs, fell asleep and did not wake up until 66 years later; of the letter that Baruch sent to Babylon with the figs that were still fresh after 66 years, and the return of the exiles led by Jeremiah, and how Jeremiah died, but rose again from the dead after three days and praised the redemption that had come through Jesus Christ. Aside from the obvious Christian interpolations, the work is clearly of Jewish origin and is supposed by many scholars to have been written soon after 135 A.D. Consult the Greek text in Rendel Harris, *The Rest of the Words of Baruch* (1889); the Ethiopic text in Dillmann, *Chrestomathia Æthiopica* (1866); German translations of the Ethiopic text by Prätorius, in *Zeitschrift für wissenschaftliche Theologie* (1872) and König in *Studien und Kritiken* (1877); cf. also Kohler, in *The Jewish Quarterly Review* (1893) and Schürer, *Geschichte des jüdischen Volkes* (4th ed., 1909).

BARUCH, SIMON (1840–). An American physician, born in Schwesens, Germany. His early education was obtained at the Royal Gymnasium at Posen, Germany, but his professional training, begun after removal to the United States, he received at the Medical College of Virginia. In the same year that he graduated (1862) he offered himself as a surgeon in the Confederate army, and until the end of the war he served in the field with the forces of Gen. Robert E. Lee. Twice he was taken prisoner while in charge of the wounded, once on the battlefield of South Mountain, Md., and once at Gettysburg. From 1865 to 1881 he practiced medicine in Camden, S. C., and after that in New York. As a consulting specialist in chronic diseases he became well known, particularly because he diagnosed as "perforating appendicitis" the first recorded case where operation was successful (1889). It was through his efforts that New York was induced to make provision for free municipal baths. By the College of Physicians and Surgeons of Columbia University Dr. Baruch was appointed professor of hydrotherapy. Besides numerous papers contributed to medical journals, his writings include *Uses of Water in Modern Medicine* (1892), and *The Principles and Practice of Hydrotherapy* (3d ed., 1908). Both these books have been translated into German, and the latter into French also.

BARUGO, bā-rōō'gō. A town in the province of Leyte, Philippines, 18 miles northwest of Tacloban, the capital of the province. Pop., 1903, 12,360.

BARUS, CARL (1856–). An American physicist, born at Cincinnati, Ohio. He was ap-

pointed professor of physics in Brown University in 1895 and in 1903 became dean of the Graduate Department. For the Geological Survey he made researches in physical geology, for the Weather Bureau in atmospheric moisture, and for the Smithsonian Institute in aeronautics. He was elected a member of the National Academy of Sciences and was in 1895 one of the committee selected by Congress to determine the electrical standards of the United States. He prepared a report on high-temperature measurement, as submitted to the International Congress of Physicists at the Paris Exposition in 1900. He contributed valuable papers to the bulletins of the United States Geological Survey, including *The Electrical and Magnetic Properties of the Iron-Carburets* (1885), *Subsidence of Fine Solid Particles in Liquids* (1886), *Measurement of High Temperatures* (1889); *Experiments with Ionized Air* (1901), *Nucleation of the Atmosphere* (1905), *Condensation of Vapor as Induced by Nuclei and Ions* (4 vols., 1907–10), *Elliptic Interferences* (1911).

BARWOOD. See CAMWOOD.

BARY, bā'rē, HEINRICH ANTON DE. See DE BARY, HEINRICH ANTON.

BARYATINSKI, bār'yā-tēn'skē, ALEXANDER IVANOVICH, Prince (1815–79). A Russian field marshal. After the accession of Alexander II he received chief command of the Army of the Caucasus (1856), and after directing three successful campaigns led the storming of Ghunib (1859), where he captured the Caucasian leader Shamyl. In recognition of these services he was appointed field marshal, but, owing to ill health, was compelled to retire soon afterward.

BARYE, bā'rē', ANTOINE LOUIS (1795–1875). A celebrated French sculptor of animals. He was born in Paris, Sept. 24, 1795. He inherited his artistic gift from his father, who was a proficient silversmith from Lyons. He began his practice of art by working with an engraver and a goldsmith. He was conscripted in 1812 and during his service is said to have modeled several relief maps for the government. He turned his attention to sculpture in 1818, when he studied modeling under Bosio and drawing under Gros. In 1819 he took a second prize at the Ecole des Beaux-Arts and a little later began devoting himself to the study of animals, and in this branch of sculpture he achieved fame. In the Salon of 1831 Barye exhibited his famous "Tiger Tearing a Crocodile" (Louvre). He gained even greater success with his "Lion Battling with a Serpent" (1832), purchased by the state for the Tuileries Garden, and found in the Duke of Orleans a liberal patron. Sometimes rejected by the jury, and not receiving the recognition by his fellow artists that he believed his due, Barye ceased sending to the Salon and gave himself finally to the production of bronzes for commerce. By this, through public appreciation, which was not lacking for his work, he raised this industry to the plane of art, and it is through these little masterpieces that he is most widely known. The posthumous exhibition of his drawings at the Beaux-Arts was the talk of Paris for the wonderful accuracy and research displayed in the studies of the anatomy, character, and movements of the various animals which he represented. Some of his work is heroic in size and ornaments public parks in France. The architect of the Louvre employed him to make four groups for the pavilion on the Place du Carrousel. Barye re-

ceived many honors—was a member of the Institute, artist at the Jardin des Plantes, and an officer of the Legion of Honor. He died in Paris, June 25, 1875. Barye's sculptures are very popular in the United States. They are most completely represented in the large collection of small bronzes and drawings in the Brooklyn Institute Museum. The Metropolitan Museum of New York is also rich in his bronzes, and Mount Vernon Place, Baltimore, is adorned by a whole series. Consult the works of Alexandre (Paris, 1889), De Kay (New York, 1889), and Ballu (Paris, 1890).

BARYTA. See BARIUM.

BARYTONE, or **BARITONE** (Gk. *βάρυς*, *barys*, heavy, deep + *τόνος*, *tonos*, tone). That species of the male voice which lies between the bass and the tenor, but is, in quality or tone character, more like the former. Its compass is G to F sharp, and composers assign to it parts that are characterized by manly vigor, power, and solidity. Barytone further means a singer possessing the barytone voice. Barytone clef, in musical notation, means the now obsolete F clef on the third line.

BAS, *bâs*, or **BATZ**. An island of the department of Finistère, France, 2½ miles distant from the north coast, in the English Channel (Map: France, N., A 4). It is about 3 miles long and 2 miles broad; is defended by two forts and four batteries; and has a lighthouse at an elevation of 212 feet. Kernoc Haven affords good anchorage. It is inhabited by fishermen and contains three villages. Pop., 1901, 1291; 1906, 1340; 1911, 1363.

BASALT' (Lat. *basaltæ*, an African word). A volcanic rock of basic composition, characterized by a fine texture and having generally one or more of the feldspathoid minerals, lime-soda feldspar, nephelite, or leucite, associated with pyroxene or hornblende, and magnetite or ilmenite; frequently also with olivine. According as one or the other of these minerals predominates, the chemical composition varies between wide limits, so that an average for basalt would have little significance. Basalts are distinguished as olivine basalts, nepheline basalts, leucite basalts, or as basalts proper, when containing as essential constituents only lime-soda feldspar and pyroxene or hornblende. The terms *dolerite*, *anamesite*, and *basalt* were used to distinguish basalts of coarse, medium, and fine grains, respectively; but since the introduction of the petrographical microscope has made accurate rock study possible, these terms have fallen into disuse, and others, describing the intimate texture of the rocks as revealed by microscopic study, have taken their place. In the preliminary study in the field, however, they have still some value for cartographical purposes.

Basalts are in all cases the products of consolidation of molten magmas, and generally of lavas which were poured out at the surface of the earth. In contrast with rhyolites and trachytes, which in their genesis they resemble, basalts, when molten, flow as comparatively thin fluids, which travel rapidly down a slope, and on solidifying ultimately build up mountains which have comparatively gentle slopes. Thus the Hawaiian Islands, which are built up of basalt from the sea bottom, have, in contrast with the slopes of the American Cordilleran volcanoes, which are generally rhyolite or andesite, exceedingly gentle slopes. Masses of basalt, when solidified at the surface, have, quite generally

near the original upper surfaces, a separation by cracks into layers parallel to the surface; whereas at greater depths there is produced a series of columns, generally hexagonal in section, and with their columnar axes perpendicular to the original surface. The upper surfaces of a basalt outflow being curved, the columns generally radiate from some point near the bottom of the mass. As the upper layers of rock have been removed by erosion in all save the most recent extrusions of lava, the platy parting is less commonly observed than is the columnar. The Giant's Causeway, in the north of Ireland, is the best-known example of columnar joints in basalt. In common with most other lavas basalt exhibits all varieties of cellular and scoriaceous texture, depending upon the quantity of steam the lava had absorbed and upon the opportunities afforded this steam to expand when it reached the surface. (For illustrations, see GIANT'S CAUSEWAY; STAFFA.) Very similar rocks to basalt are diabase, melaphyre, and augite porphyrite.

BASANITE, *bāz'a-nīt*. A name long used to designate certain fine-grained black rocks of varied character and origin. It was originally applied to the basalts. It was also used for a fine compact quartz rock that served as a touchstone by which the jeweler tested the fineness of gold. The name is now applied by petrographers to certain varieties of basic volcanic rocks that differ from basalt in having a considerable amount of leucite or nepheline in addition to the usual augite, olivine, and plagioclase. The basanites have a rather limited distribution. See TOUCHSTONE.

BASARISK. See CACOMISTLE.

BAS'COM, FLORENCE. An American geologist, daughter of Dr. John Bascom. She was born in Williamstown, Mass. In 1882 she graduated with the degrees of A.B. and B.L. at the University of Wisconsin, from which institution she also received the degree of B.S. in 1884. She continued her studies at the University of Wisconsin, taking her master's degree there, and at Johns Hopkins University, where she received the degree of Ph.D. She became a member of the American Academy for the Advancement of Science and of the Philadelphia Academy of Science, and assistant editor of the *American Geologist*. She was made professor of geology in Bryn Mawr College in 1906. After 13 years of service as a member, she became a geologist of the United States Geological Survey in 1909. She published (1904) *Water Resources of the Philadelphia District* and (1905) *The Piedmont District of Pennsylvania*.

BASCOM, JOHN (1827–1911). A distinguished American educator, born at Genoa, N. Y. He graduated at Williams College in 1849, was a tutor there from 1852–53, and graduated at the Andover Theological Seminary in 1855. He was professor of rhetoric at Williams from 1855 to 1874, when he was chosen president of the University of Wisconsin. At Wisconsin, in addition to the presidency, he also held the chair of mental and moral philosophy. He withdrew from the university in 1887 and returned to Williams to accept the chair of political science, which he held until he retired in 1901. Dr. Bascom was prominent as a speaker and a writer on both religious and secular subjects. His works include a textbook of *Political Economy* (1859), *Aesthetics* (1862), *The Principles of Psychology* (1869), *The Philosophy of English*

Literature (1874), *Philosophy of Religions* (1876), *Ethics* (1879), *Problems in Philosophy* (1885), *The New Theology* (1891), *Social Theory* (1895), *The Growth of Nationality in the United States* (1899), and *God and His Goodness* (1901).

BASCULE BRIDGE. See BRIDGE.

BASE, *bās* (Fr. and It. from Lat. *basis*, Gk. *básis*, *basis*, a stepping, step). In architecture, the foot or lowest part or division of any architectural construction, such as a wall, pier, or column. The base as an architectural feature had a progressive development in the styles of classical antiquity. The Egyptian column had no base, or only (rarely) a plain round plinth or disc; and the Ægean or Mycenaean base was likewise of the simplest sort. The Greek Doric order employed no base; but the Ionic developed in Asia Minor in the sixth century B.C. an elaborate type which in a somewhat simpler form became the typical base of the Attic-Ionic style and has been ever since known as the Attic base. It consists of two tori or convex moldings (the upper slightly smaller than the lower), separated by a scotia or concave molding between two narrow fillets, the whole resting on a flat square plinth. The total height is normally about half the column diameter. The Attic base was used by the Greeks for the Corinthian as well as the Ionic order. The Asiatic Ionic bases varied considerably, often omitting the plinth or one torus and exaggerating the scotia, fluting the moldings, etc. The Romans adopted the Attic base, but elaborated it variously, making a special Corinthian base by substituting two small scotiae separated by a double bead for the single scotia of the original type. They devised simpler bases for the Tuscan and Doric orders—a large torus on a thick plinth for the first, a bead and torus on a less massive plinth for the second. In the later Imperial age the Attic and Corinthian bases were sometimes elaborately carved with foliage. The ancient Persians in the sixth and fifth centuries B.C. employed for their columns a high bell-shaped base carved with palm leaves and surmounted by a torus and bead. In mediæval architecture the Attic type was the most prevalent, from the earliest Christian times, but in and after the tenth century it was greatly modified in its proportions, flattened or heightened according to its position below or above the eye, the profiles made with elliptical or hyperbolic instead of circular curves, and (in the Romanesque styles) spurs, claws, or leaves carved above the plinth to conceal the flat triangular areas at its corners. In the Lombard style the columns of porches and pulpits often rested on the backs of symbolic sculptured lions or monsters. In the Gothic styles the plinth is often high, octagonal, sometimes beveled at the top; the spur leaves are omitted and the Attic profiles sometimes replaced by a profile like a high inverted Greek Doric echinus. In the later Gothic the height of the plinth is greatly exaggerated, and it is often mounted on a high sub-plinth, while each shaft of a cluster has its own separate compound plinth. Renaissance architecture reverted to classic types, and these have been found so perfectly adapted to their purpose that even the most progressive modern architecture has ventured on only the most trivial variations of their details, except in the more extreme phases of the *Art Nouveau* (q.v.) and *Moderne*

Kunst in France, Germany, and Austria. See ATTIC; COLUMN; ORDERS OF ARCHITECTURE.

BASE. In chemistry, any substance containing one or more hydroxyl groups (OH) and capable of combining with acids to form salts. The inorganic bases are nearly all metallic hydroxides (e.g., potassium hydroxide, KOH), and those soluble in water turn red litmus paper blue—a reaction now attributed to their hydroxyl ions, i.e., hydroxyl groups charged with negative electricity. The organic bases, too, are assumed to contain hydroxyl ions in aqueous solution. Thus aniline, $C_6H_5NH_2$, is supposed to change in water to $C_6H_5NH_2OH$ and then to be partly broken up into $C_6H_5NH_2$ ions and OH ions. The "strength" of bases is now measured principally by comparing their electrical conductivities. See AMINES; ALKALOIDS; PTOMAINES; ACIDS; DISSOCIATION; SOLUTION; ELECTRO-CHEMISTRY, GENERAL.

BASE. See HERALDRY.

BASE. See BASS.

BASEBALL (named from the "bases"; see below). A game of ball—America's national game. Ball playing was a favored form of recreation in the days of the ancients, and frequent reference is made to it by the Greek and Roman writers, but the modern game of baseball, at whose shrine millions gather every year, came into being suddenly and soon saw itself established as the most popular branch of athletics in the United States.

It was not until 1907 that any real attempt was made to investigate the circumstances surrounding the birth of the present game, although it was generally agreed that baseball sprang from the old English game of *rounders* (q.v.). The game played by the early American settlers, which was known as "town ball," undoubtedly was a direct offspring of rounders. But more radical variations in the original sport were not long in appearing, upon which were bestowed such names as "three-old cat," "four-old cat" and "scrub." To a combination of these pastimes baseball probably owes its inception.

The purpose of the research, made in 1907, however, was primarily to determine who actually laid the foundations for the present scheme of playing the game and when they were laid. To determine these historical facts a commission was appointed by those interested in the professional end of the game, consisting of A. G. Mills of New York; Arthur P. Gorman, former United States Senator from Maryland; Morgan G. Bulkeley, former Governor of and United States Senator from Connecticut; N. E. Young, A. J. Reach, George Wright, and James E. Sullivan. This body, after several months' work in collecting evidence, reported that according to their findings the "national game of baseball" originated with the Knickerbocker Club, organized in New York City in 1845, and that the first person to prepare a diagram of the playing diamond was Abner Doubleday of Cooperstown, N. Y., in 1839.

The Knickerbocker Club, or first organized baseball club in the world, was in existence 30 years. Its first rival, a group of players calling themselves "The New York Nine," was founded early in 1846 and soon afterward challenged the Knickerbockers to play a match game for a dinner. This, the first contest of its kind, took place in Hoboken, N. J., June 19, 1846, the challengers winning by a score of 23 to 1. According to the rules then in vogue the victory

was decided when either team scored 21 *runs*, and in the Hoboken contest this required only four *innings*. The rules at that time also provided that the *batter* was *out* if the ball he hit was caught on the first bounce or if, when running between the bases, he should be struck with the ball thrown at him by a member of the opposing team. Another interesting feature was that the *pitcher* delivered the ball to the batter with a straight-arm motion. He was, in fact, a "pitcher" of the ball and not a "thrower," as in the present game.

In 1850 another team appeared known as the "Washingtons," and later as the Gotham Club, which had grounds in Yorkville. Other clubs soon sprang up, and, by 1858, 25 organized teams were playing baseball in and about New York City. It was in 1858, too, that the National Association of Baseball Players was founded and a new code of playing rules adopted. That year also was noteworthy in baseball history as the one in which an admission fee (50 cents) to a game was first charged, the occasion being the match on July 20 between New York and Brooklyn teams at the Fashion Race Course.

The next stage in the development of the game was the organization in 1869 of the first professional club, the Cincinnati "Red Stockings." This team during 1869 and 1870 traveled 12,000 miles and played to more than 200,000 persons, thus giving the first indication of the popularity the sport was destined to attain. A natural outcome of this first experiment in professional ball playing was the organization in 1871 of the National Association of Professional Baseball Players by the members of 10 clubs and the arrangement of a series of contests between them. Only eight teams, however, finished the season. They were, in order, the Athletics of Philadelphia, the Bostons, the White Stockings of Chicago, the Haymakers of Troy, the Mutuals of New York, the Forest Citys of Cleveland, the Nationals of Washington, and the Forest Citys of Rockford.

Just when the professional game seemed firmly established troubles arose which threatened for a time to deal the sport a deathblow. Gambling on the results of the games became prevalent, the players were corrupted, occasionally "throwing" games, and liquor was sold on or near the ball fields. Fist fights on the grounds also were of frequent occurrence. As a result of all this, the better element withdrew their support and the attendance at the games fell off to such an extent that in 1875 practically every professional club was on the verge of bankruptcy.

At this crisis William A. Hulbert, A. G. Spalding, and other lovers of the sport determined upon a complete reorganization of the game along business lines. This movement eventually resulted in the forming of the National League of Professional Baseball Clubs, and the professional game to-day is conducted under the constitution then adopted by the league. The objects of the new organization, as stated were "(1) to encourage, foster, and elevate the game; (2) to enact and enforce proper rules for the exhibition and conduct of the game, and (3) to make baseball playing respectable and honorable."

Morgan G. Bulkeley of Connecticut, already referred to in this article, became the first president of the league, and the clubs represented were Boston, Cincinnati, Hartford, Chicago, Louisville, New York, Philadelphia, and

St. Louis. The first pennant race was won by Chicago, with Hartford second. Other pennant winners in the National League have been: 1877, Boston; 1878, Boston; 1879, Providence; 1880, Chicago; 1881, Chicago; 1882, Chicago; 1883, Boston; 1884, Providence; 1885, Chicago; 1886, Chicago; 1887, Detroit; 1888, New York; 1889, New York; 1890, Brooklyn; 1891, Boston; 1892, Boston; 1893, Boston; 1894, Baltimore; 1895, Baltimore; 1896, Baltimore; 1897, Boston; 1898, Boston; 1899, Brooklyn; 1900, Brooklyn; 1901, Pittsburgh; 1902, Pittsburgh; 1903, Pittsburgh; 1904, New York; 1905, New York; 1906, Chicago; 1907, Chicago; 1908, Chicago; 1909, Pittsburgh; 1910, Chicago; 1911, New York; 1912, New York; 1913, New York.

The National League was the forerunner of hundreds of other leagues throughout the United States and Canada, all being conducted under the same general principles. Of these organizations the most important are American League, International League, American Association, Southern League, Eastern Association, Western League, Pacific Coast League, and New England League. Of these leagues the strongest is the American League, which was founded in 1900. Starting as a rival league to the National, the American later entered into an agreement with the older body, and the two now work in perfect harmony.

The pennant winners in the American League have been: 1900, Chicago; 1901, Chicago; 1902, Philadelphia; 1903, Boston; 1904, Boston; 1905, Philadelphia; 1906, Chicago; 1907, Detroit; 1908, Detroit; 1909, Detroit; 1910, Philadelphia; 1911, Philadelphia; 1912, Boston; 1913, Philadelphia.

The principal event in the professional baseball world is the playing of a series of games between the winning teams of the two strongest leagues for the world's championship. These contests, which began in 1884, attest in no uncertain way the great popularity of baseball with the masses of the people. They attract as a rule more than 150,000 spectators, and the receipts, which are divided between the players, clubs, and National Commission, often amount to more than \$300,000. The first world's championship was won by the Providence National League team in 1884, the opposing team being the Metropolitans. Other holders of the world's title have been: 1886, St. Louis (A. A.); 1887, Detroit (N. L.); 1888, New York (N. L.); 1889, New York (N. L.); 1892, Boston (N. L.); 1894, New York (N. L.); 1895, Cleveland (N. L.); 1896, Baltimore (N. L.); 1897, Baltimore (N. L.); 1903, Boston (A. L.); 1905, New York (N. L.); 1906, Chicago (A. L.); 1907, Chicago (N. L.); 1908, Chicago (N. L.); 1909, Pittsburgh (N. L.); 1910, Philadelphia (A. L.); 1911, Philadelphia (A. L.); 1912, Boston (A. L.); 1913, Philadelphia (A. L.).

The first effort to introduce America's national game in foreign countries was made in 1874, when a team from the United States played several games in Great Britain. This was followed in the winter of 1888 and 1889 by a tour of the globe on the part of two American teams. New Zealand, Australia, Egypt, Italy, France, and Great Britain were the countries visited. Baseball, however, has made very little appeal to Great Britain or the continental European countries, although it is popular in Cuba and Hawaii and is gaining a strong foothold in Japan.

In the American colleges baseball early became a favorite game. The first recorded intercollegiate match was played at Pittsfield, Mass., July 1, 1859, between Amherst and Williams, the former winning by a score of 66 to 32. Before the game it was agreed to play until one of the teams scored 65 runs, and it is interesting to note that it required four hours to finish the contest. Various attempts have been made to establish an intercollegiate baseball league patterned after the professional organization, but they have invariably met with failure. This fact makes it impossible to determine definitely which of the colleges turns out the best team from year to year, and the college championship title is always in dispute. The colleges which have made the best showings in baseball, often developing teams which have gained victories over strong professional clubs, include Princeton, Harvard, Yale, Williams, Brown, Virginia, Georgetown, and Pennsylvania. Many of the best professional players are men who gained their knowledge of the game while in college.

The Game—Baseball is played by nine men in each team, on a level field, on which is laid out

the form of a "diamond" 90 feet square, with bases at each of the four corners (see diagram). One of these bases is called the home plate, and the others (beginning with the right) first, second, and third respectively. Within the diamond, in front of the home plate and 60.5 feet from it, is the pitcher's position, or "box."

The home team has the choice of innings—which team shall take the position "in the field" or "take the bat." The fielders are divided into the *battery* (pitcher and catcher), the *infield* (the three basemen and shortstop), and the *outfield* (left, centre, and right fielders).

The fielding side having taken position, the pitcher delivers the ball to the batsman standing at the home plate, who endeavors to hit it out of the reach of the fielders and thereby succeed in reaching first base before the opposing side can field the ball to the baseman standing there. If the batsman fails to reach the base,

he is called "out." If he should reach the first base, and think it safe to do so, he next tries to reach the second base, and the third, or even the home plate. When he has stopped at any base, another batsman of his side is put in, and he in turn attempts to hit the ball so as to allow the first batsman to advance around the bases, while he, in his turn, attempts to reach the first or any succeeding base. Then a third batsman of the same side comes up, and so on, until three men are put out in any way, when the other side takes its turn at the bat. A circuit of the bases is called a "run," and if any player makes it on a single hit it is called a "home run." A "strike" is called (1) when the batsman fails to strike at a ball that passes over the home plate between his knee and shoulder; (2) if he strikes at any ball and fails to hit it; (3) in case of a foul hit, i.e., one that drops or rolls outside the lines from the home plate to first and third bases, but the third strike, however, is not called on a foul.

The batsman becomes a base runner (1) after three strikes are called; (2) when he makes a fair hit, the ball traveling between the above-mentioned lines until after it passes first or third base; (3) after four balls have been called by the umpire, a "ball" being a pitched ball which is not struck at by the batter and which passes outside the limits required for a strike; (4) if he is hit by the ball, unless he has made no effort to avoid it; and (5) if prevented from striking by the interference of the catcher. In the last three cases he cannot be put out before reaching first base. He is put out (1) when his third strike is held by the catcher or fielded to first base ahead of him; (2) when a ball hit by him is caught by a fielder before it touches the ground; (3) when touched with the ball in the hands of a fielder while between bases; (4) when, if forced to run to any base, the ball is held by a fielder on that base before the runner reaches it; and (5) when hit by a batted ball. Nine innings for each side constitute a game, and the team scoring the greater number of runs wins. In case of a tie at the end of the ninth inning the play is continued until one side scores more than the other in the same number of innings.

For complete rules and other information concerning baseball, consult Chadwick, "Official Baseball Guide," in the *Spalding Athletic Library* (New York, annually). For practical instruction: Chadwick, *Art of Pitching, Fielding, and Base-Running* (New York, 1886); J. M. Ward, *Baseball* (Philadelphia, 1888); A. G. Spalding, *America's National Game* (New York, 1911).

BASE-COURT, bäs'kört (Fr. *basse-cour*, low court). The lower or outer court of a mansion, corresponding to the outer bailey of a castle (q.v.); the service court.

BASEDOW, bäs'ze-dö, or **BASSEDAU**, JOHANN BERNHARD, often called BERNHARD VON NORDALBINGEN (1723-90). A German educational reformer of the eighteenth century. He was born at Hamburg and studied philosophy and theology at the University of Leipzig. He became professor of moral philosophy in the Academy of Sorö in Denmark in 1753; was transferred to the gymnasium at Altona in 1763, but was soon again compelled to give up teaching, though he retained his salary. At both Sorö and Altona Basedow had fallen into difficulties on account of his extremely unorthodox

religious views, expressed in both his teaching and his writings. While at Altona he came under the influence of Rousseau's *Emile*, and in 1767 definitely abandoned theology for educational affairs. His important position in education was due to his attempt to interpret and put into practical application the revolutionary ideas of Rousseau, by proposing a general reform in education in Germany in respect to organization, methods of instruction and the training of teachers. In 1768 he issued *An Address to the Friends of Humanity and to Persons in Power, on Schools, on Education, and its Influence on Public Happiness*, which included the plan for his *Elementarwerk*, a complete new system of primary education. This was received with favor, and his appeal for funds with which to publish the proposed treatise met with generous response. The *Elementarwerk*, an illustrated work in four volumes, was issued in 1774 and exerted a wide influence. The ideas underlying the work were a combination of the methods of the *Orbis Pictus* of Comenius (q.v.) and the general principles advanced by Bacon and Rousseau. It contained a vast amount of general information arranged in dialogue form and designed to direct and train, but never to suppress, the natural desires of children. Public approval of the ideas advanced was generous, and Basedow immediately outlined a plan for the training of teachers for the new education.

The resulting institution was the celebrated *Philanthropinum*, founded at Dessau in 1774 and soon imitated in various parts of Germany. Basedow was unfit for the management of such an institution, however, and failed in carrying out his own ideas. The *Philanthropinum*, under more competent hands, continued to exist until 1793 and exerted a wide influence on the education of children throughout the Teutonic world. Basedow passed the last year of his life in private tutoring. The fundamental idea of the reform was "education according to nature," which was interpreted to mean that children should be treated as children, not as adults; that language should be taught by conversational methods, not through grammatical studies; that physical exercise and games should find a place in the child's education; that early training should be connected with "motion and noise," since the child naturally loves these; that each child should be taught a handicraft, for reasons partly educational, partly social; that the vernacular, rather than the classical languages, should constitute the chief subject-matter of education; that instruction should be connected with realities rather than with words. Many of the reforms suggested by Basedow were carried out by more practical and less erratic reformers, such as Pestalozzi and Froebel. Prof. Max Müller, Basedow's great-grandson, contributed a "Life" of the reformer to the *Allgemeine deutsche Biographie*. A comparison of Basedow and Comenius by Petru Garbovicianu (Bucharest, 1887) is commended by Quick.

Consult: Quick, *Educational Reformers* (New York, 1890); Barnard, *German Teachers and Educators* (New York, 1861); Pinloche, *L'Education en Allemagne au dix-huitième siècle* (Paris, 1889); Diestelmann, *Basedow* (Leipzig, 1897).

BASEDOW'S DISEASE', GRAVES'S DISEASE, or EXOPHTHALMIC GOITRE. A disease characterized by palpitation of the heart, rapid pulse, en-

largement of the thyroid gland, anæmia, general nervousness, fine tremor and prominence of the eyeballs. It was first fully described by Von Basedow in 1840. The etiology is obscure; the exciting cause may be mental or physical shock, or anxiety or grief, fright, fatigue, sexual excess in those with a nervous inheritance; but the disease is always associated with increased activity of the thyroid gland—hyperthyroidism. It is 8.3 times as frequent in females as in males. The modern treatment of this affection is very satisfactory. The gland may be reduced in size and the symptoms relieved by the application of the X-ray; serum therapy cures many cases, and surgery attacks the problem by ligating the superior thyroid arteries, resecting the hypertrophied portions of the gland, or removing the cervical sympathetic ganglion. Consult article by Dock in *Osler's Modern Medicine*, vol. vi (New York, 1909); for early literature, article by same author in the *Jour. Amer. Med. Assoc.*, p. 1121 (1908); Mannheim, *Der Morbus Gravesii* (Berlin, 1894).

BASEILHAC, bâ'zâ'lyâk', JEAN (1703-81). A French surgeon, better known as Frère Côme. He was educated at the Hôtel-Dieu, Paris, and for some time was physician in ordinary to the Archbishop of Bayeux. He invented the "trocar," used in cystotomy, and wrote *Recueil de pièces importantes concernant la taille faite par le lithotome caché* (1751) and *Nouvelle méthode d'extraire la pierre de la vessie urinaire par dessus de pubis* (1779).

BASEL, bâ'zel, or **BALE**, bill (anciently, *basilia*, royal residence, from Gk. *βασίλεις*, *basileus*, king; *basula* in the Middle Ages). The capital of the half-canton of Basel-Stadt, Switzerland; lying on both sides of the Rhine, near the northern boundary of Switzerland (Map: Switzerland, B 1). The city is situated in a charming plain over 800 feet above the sea level and is divided by the river into Grossbasel and Kleinbasel. The former, the higher portion of the city, is on the left bank and is connected with Kleinbasel by three bridges, one of which, a fine granite structure, was completed in 1905, replacing the wooden Alte Brücke (Old Bridge), which was built in the early part of the thirteenth century. The city proper shows its medieval origin, but about it are charming suburbs, occupied by the richer classes. The old ramparts have been leveled to form walks and promenades. In the Eschenplatz stands the Sankt Jakob Monument, to the memory of the Swiss who opposed the Armagnac invaders in 1444. Other memorials are the Strassburg Monument, by Bartholdi, commemorating the aid given by Switzerland to the women and children of that city after the siege of 1870, and the Holbein Fountain, restored in 1887.

Basel abounds in fine buildings, both mediæval and modern. Among these may be mentioned the Rathaus or Town Hall, built in the first quarter of the sixteenth century, and restored early in the twentieth; the Minster, said to have been begun by Emperor Henry I, and the cathedral of the bishopric of Basel until 1529; and the large Barfüsser Kirche, dating from the fourteenth century. The latter has a very high choir and is now the quarters of the Historical Museum, which vies with that of Zürich as the finest in Switzerland. Other notable buildings are the church of St. Elizabeth, the church of St. Paul, the Natural History and Art Museum, the Kunst Halle, containing a

collection of modern paintings, the theatre, and the post office.

Basel has a university which dates from 1459. (See BASEL, UNIVERSITY OF.) The botanical gardens and the institute of natural sciences, as well as the clinics attached to the city hospitals, are affiliated with the university. Besides the university there are several high schools and an industrial school and museum. The Historical Museum, which has been mentioned, contains some portions of the celebrated *Danse Macabre*, formerly a fresco in the Dominican burial ground and removed in 1805, besides a fine collection of mediæval furniture and plate. Basel was the home of the Holbeins, and the museum contains a valuable collection of their works and those of their pupils. There are several literary, musical, historical, and scientific societies. A notable organization is the Association for Public Welfare, which cares for schools and other institutions designed for the bettering of the condition of the poor and the afflicted, such as the blind, stuttering, etc. Basel's hospitals include a Polyclinic supported by the state, while its mission house and Bible Institute are world-famous.

Basel has long been the leading commercial town of Switzerland and an important manufacturing centre. For more than 200 years ribbon making has been an important occupation. Other branches of industry are paper making, silk and thread spinning, dyeing and dye making, and the preparation of the "Baseler Leckerli," or honey cakes. Total number of factories in Basel-Stadt in 1911, 287; with 15,639 work people (9723 men, 5916 women). The position of the city on the boundaries of Switzerland, Alsace, and Baden, and its location on the Rhine, here navigable, give it great advantages for trade, and it receives more than 50 per cent of the total imports of Switzerland. It is an important centre for the transport of the native products of the country, and as a result Basel is the most powerful financial city of Switzerland. Besides the communications given by the Rhine and the Rhine-Rhone canals, railroads from various parts of Switzerland form a junction in Basel, permitting connections with France.

The Basel-Stadt demicanton consists of the city and two rural communes; the cantonal councils have general jurisdiction over the city. In 1888 the population of the city was 74,245; in 1900, 112,885; according to the census taken Dec. 1, 1910, the *de facto* population of the city was 132,577 (*de jure*, 132,276), and of the rural communes 3771 (3672). Of these over two-thirds are Protestants, less than one-third Catholics, with about 3000 Jews.

Basel had its origin in the *Basilia* of the Romans, a frontier post situated near the town of Augusta Rauracorum. It was taken in turn by the Alemanni and the Franks, and on the partition of Charlemagne's Empire passed to Louis the German. In the eleventh century it enjoyed great prosperity as a free Imperial city, ruled by its bishop and the chief nobility. In the course of many years the burghers acquired a large share in the municipal government, while at the same time the authority of the city, by purchase and conquest, was extended over a broad stretch of territory. Basel fought with the Swiss confederates against the Hapsburgs in 1444 and formally joined the Confederacy in 1501. The Reformation made rapid progress in

Basel. The government of the city became thoroughly democratic, but towards the inhabitants of the rural districts of Basel a policy of consistent selfishness was followed, in that they were allowed no share in the political life of the community for nearly three centuries. Under the impulse of the French Revolution equality of rights was established, but the city became supreme again after 1814. Civil war broke out as a result in 1831 and continued until 1833, when the Federal government intervened and brought about the division of the canton into *Basel-Stadt* and *Basel-Land*. The latter immediately established democratic institutions, but Basel-Stadt maintained its reactionary character till well into the second half of the nineteenth century. Consult *Guide to Basel and Environs* (Basel, 1895).

BASEL, CONFESSION OF. 1. Written by Oswald Myconius (q.v.), and published in 1534, still used in Basel. 2. The First Helvetic Confession (1536), also called The Second Confession of Basel, because there drawn up. It was too Lutheran and so was supplanted by the Second Helvetic Confession (1564). Consult Schaff, *Creeds of Christendom* (New York, 1884).

BASEL, COUNCIL OF. A memorable and important ecclesiastical council, held in the city of Basel from 1431 to 1449. It was summoned by Pope Martin V, by a bull dated Feb. 1, 1431, and constituted after a fashion on February 27, but after the Cardinal legate, Julian Cesarini of Sant' Angelo, who had been charged with the conduct of the council, arrived, Sept. 9, 1431, more life was put into it. Its chief business being to conciliate the Hussites, it at once opened negotiations with them. But the new Pope, Eugenius IV, disliked the proceedings, and requested Cesarini on November 12 to dissolve the council and call another a little later at Bologna. Ere the letter came the council had formally constituted itself (December 14), and when the Pope's letter arrived it flatly refused to dissolve, and reaffirmed the decree of the Council of Constance, asserting the right of a general council to exercise authority over the Pope himself, and on his persevering to issue bulls for its dissolution, caused a formal process to be commenced against him and cited him to appear at its bar. It assumed the papal powers, and exercised them in France and Germany, where its authority was acknowledged. It concluded a peace, in the name of the Church, with the Calixtines, the most powerful section of the Hussites, by the so-called Compactata of Prague of Nov. 30, 1433, granting them the use of the cup in the Lord's Supper. By this the Emperor Sigismund was greatly aided in recovering possession of Bohemia; and he in return sought to reconcile the council with Eugenius IV, who, being hard pressed by insurrections in the States of the Church, and, afraid of losing his whole influence in France and Germany, came to a temporary agreement with the council Aug. 1, 1433. Desirous, however, of limiting the papal prerogatives, the council restored to the chapters of cathedrals and collegiate churches the free right of election to stalls and benefices, of which the Pope had assumed the right of disposing; and with a view to the reformation of gross abuses, restricted the practice of appeals to Rome and prohibited *annats* and other grievous exactions. It left the Pope the right to dispose of those benefices only which belonged to the diocese of Rome and prohibited

the bestowal of reversions to ecclesiastical offices. It also appointed punishments for certain immoralities in the clergy; and prohibited "festivals of fools," and all the indecencies which had been commonly practiced in churches at Christmas. It adopted decrees concerning the election of Popes and for the regulation of the College of Cardinals.

Eugenius, exasperated to the utmost, complained loudly to all sovereign princes. At this time the prospect was opened up of the union of the distressed Greeks with the Church of Rome, and both the Pope and the council endeavored to make use of this for the advancement of their own interests and influence. Both dispatched galleys for the Greek deputies; but through the intrigues of his agents, the Pope was successful and brought the Greek deputies to Ferrara. The Archbishop of Taranto, a papal legate at Basel, circulated an ordinance in the name of the council, and sealed with its seal, recommending Udine or Florence as the place of conference. This was a high-handed proceeding, as not the council, but only a minority of the council, desired such a transfer, and the use of the seal was unauthorized. The Archbishop of Taranto was arrested, but he escaped. Yet the Pope followed the minority and issued a bull calling a council at Florence.

This proceeding put an end to forbearance on the part of the council, which, on July 31, 1437, again summoned the Pope to its bar and, on his failing to appear, not only declared him contumacious (Oct. 11, 1437) but, on his transferring the council to Ferrara, went so far as (on Jan. 24, 1438) to decree his suspension from the functions of the papacy. His party was, however, so strong that this decree could not be carried into effect; while some of those who had been among the more influential members of the council, the Cardinal legate Julian himself, and the greater number of the Italians, had shortly before left Basel and gone over to the Pope's side. All the more resolutely did Cardinal Louis d'Allemand, Archbishop of Arles, a man of most superior understanding, courage, and eloquence, now guide the proceedings. On May 16, 1439, the council declared the Pope a heretic for his obstinate disobedience to its decrees; and on June 25, 1439, formally deposed him for simony, perjury, and other offenses, and elected in his stead Amadeus VIII of Savoy, who called himself Felix V (q.v.).

In the latter part of 1443 Felix V left Basel and went to Lausanne. On May 18, 1448, Frederick III forbade the city of Basel longer to harbor the council. So, on June 25, it decreed its transfer to Lausanne; and there, on April 25, 1449, it decreed its dissolution. The council had shown itself powerless to effect the reforms in the Papal Curia with which it had set out and was on the whole a failure. Its reforming decrees are held to be invalid by the Roman Catholic canonists; but extreme Gallicans, such as Richer, recognize it as ecumenical all through, and the more moderate ones, with Natalis Alexander, up to the prorogation to Ferrara.

Consult: *Monumenta Conciliorum Generalium Sæculi XV* (Vienna, 1857-96), *Concilium Basiliense*; *Studien und Quellen zur Geschichte des Konzils von Basel*, edited by Von Haller (3 vols., Basel, 1896-1900); also C. J. Hefele, *Konzilien-geschichte*, vol. vii (Freiburg, 1891).

BASEL, TREATIES OF. Two important treaties of peace, concluded at Basel on April 5, and

July 22, 1795, the first between France and Prussia, the second between France and Spain. Prussia withdrew from the coalition against France, took under her protection all the states of northern Germany which should, like herself, relinquish the war in which the German Empire was engaged, and gave up her possessions beyond the Rhine. The treaty is important in that it put back for some time all possibility of German unity. Spain gave up her portion of Haiti and prepared the way for that alliance with France which was afterward productive of consequences so important during the Napoleonic wars.

BASEL, UNIVERSITY OF. A university authorized by a papal bull in 1459 and opened in 1460. During the Reformation it was reorganized on a Protestant basis and became the stronghold of Protestant scholarship and as such exerted an influence throughout the world. Erasmus, who came to Basel in 1520, and Ecclampadius, who came in 1523, were among the famous teachers, and, at a later day, Euler and the Bernoullis were renowned professors of mathematics there. Basel is now the chief seat of theological study in Switzerland. It has also faculties of law, medicine, and philosophy, a library of over 250,000 volumes and 4000 MSS., chiefly dealing with the Reformation, besides other valuable collections and museums. There were in 1912-13 nearly 950 students in attendance.

BASE LEVEL. See **PHYSIOGRAPHY**.

BASE LINE. See **GEODESY** and **SURVEYING**.

BASEL/LA (probably a native name in Malabar). A genus of tropical plants belonging to the family Chenopodiaceæ. The genus is now believed to consist of but one species, *Basella alba*. Various forms of this are cultivated in the tropics as pot herbs, and in the neighborhood of Paris plants are sometimes raised in hotbeds and planted out as a substitute for spinach.

BASEMENT (Fr. *bas*, low; cf. Eng. *base*, low, mean). In architecture, the lower story of a building when not its main story. It is usually distinguished from the rest of the house by a simpler and more massive architectural treatment. Mediæval and Renaissance palaces were almost invariably built with basements, which contained porter's lodge, storerooms, offices, etc.; the windows were smaller than those of the other stories and often barred. In many cases this basement itself consisted of two stories, the upper one being a mezzanine where the servants had their quarters. In modern public buildings generally the main first story is usually raised above a basement of more or less importance. In American city residences (especially in New York) the names "American," "English," and "French" are applied to different types of basement, with reference to their interior arrangement; but these terms are arbitrary and local.

BASE OF OPERATIONS. The base, or point from which active operations against an enemy are directed or organized, and from which are issued such stores and munitions of war as may be required by the force whose base it is. In countries sparsely populated, armies, and particularly the invading army, must be victualled and supplied from their own base. Lines of operation therefore follow navigable rivers or railroads; and the base is fixed at such a point on the line or route as to be as secure as possible from molestation and yet, if necessary, give protection and shelter to the troops, should

they be driven back. The more important field hospitals are also stationed at the base. To separate or cut off an army from its base is practically to defeat it; the attainment or defeat of such an end being a consummation ardently sought for. The history of the American Civil War (1861-65) is full of instances of such manœuvring. Grant's operations against Vicksburg in December, 1862, are a case in point. In the British-Boer War of 1899-1902 England was forced to keep nearly twice as many troops as there were Boers actually in the field for the sole purpose of guarding the various bases of supplies and operations. This was due to the wide area of the theatre of operations, the absence of available rivers, and the necessity of transporting the large quantities of food and ammunition required for the vast armies in the field. In the case of an invading army operating across the sea, a base must be captured by some means and held securely as a preliminary to the campaign. The Japanese in the war against Russia (1904-05) first established a base at Chemulpo, then at Dalny, where all their supplies were landed and whence they were distributed to the army. The capture of this base would have meant disaster to the army.

BASEY, bá'sá. A town on the north shore of San Pedro Bay in the province of Samar, Philippines. It is 35 miles southeast of Catbalogan. Pop., 1903, 13,504.

BASH, BERTHA RUNKLE. See RUNKLE, BERTHA.

BASHA. See PASHA.

BA'SHAN (Heb. rich soil, in Gk. *Βασάν*, *Basan*), or **BAT'ANÉ'A**. A district of Palestine stretching from Mount Hermon in the Antilibanus on the north to the brook of Jabbok (the modern Nahr el Zerka) on the south, and from the Jordan on the west to the boundaries of the Geshurites and Maachathites on the east (Map: Palestine, E 2). Ashtaroth, Edrei, Golan, and Salehah were its chief cities. According to the account in Num. xxi. 33-35, and Deut. iii. 1-3, the last of its Amorite rulers was the giant Og, who with all his sons was killed by the Israelites under Moses at the battle of Edrei and the land given to the half tribe of Manasseh (Josh. xiii. 29-31). Bashan, as a rich pasture land, was famed for its sheep and oxen, which, because of their large size, suggested to the prophets types of oppressors (Amos iv. 1). The oak plantations of Bashan also seem to have made a strong impression on them (Ezek. xxvii. 6; Isa. ii. 13). Bashan corresponds to the district now called Hauran. In Roman times Batanæa formed one of its five provinces, the others being Ituræa, Gaulanitis, Trachonitis, and Auranitis. See HAURAN.

BASHFORD, JAMES WHITFORD (1849-). An American educator, born at Fayette, Wis. He graduated at the University of Wisconsin in 1873, studied at the theological school of Boston University, and from 1875 to 1889 was pastor of Methodist Episcopal churches at Boston and Auburndale, Mass., Portland, Maine, and Buffalo, N. Y. In 1889 he was appointed president of the Ohio Wesleyan University and held the office till 1904, when he was made bishop of the Methodist Episcopal church. He took an active part in organizing missionary work and relief measures for the famine in China. He published: *Outlines of the Science of Religion* (1891); *The Awakening of China* (1906); *China*

and Methodism (1906); *God's Missionary Plan for the World* (1907).

BASHI, bâsh't (Turk. *bashi*, head, chief). A generic title for Turkish military officials. Some of the most prominent are: *Toptchij-Bashi*, general of artillery and inspector of forts, etc.; *Solaki-Bashi*, commander of the archers (now practically extinct); *Sanjak-Darlars-Bashi*, chief of the 50 color bearers, *Konadjî*, or *Konakji-Bashi*, quarter master-general (or chief of the barracks); *Boyuk-Bashi*, great high chief, or colonel of a regiment of 1000 militia. Other military and civil Turkish titles are: *Pasha*, general—which title, however, may be conferred as a distinction on naval officers or distinguished professional men in the civil walks of life. It is the Turkish equivalent of the European "Lord," or "Baron," and is the title of viceroys, provincial governors, etc. *Bey*, a civil title equivalent to the English baronet or knight, which may be conferred on all classes, civil or otherwise. *Effendi*, the courtesy title of a gentleman, used in the same relation as the English word "esquire." *Bimbashi*, or *Himbashi*, is the title adopted in the Anglo-Egyptian army for the colonel of a battalion or regiment; its native usage is "leader of a thousand." *Beg*, or *Beik-Bey* is a title commonly applied to all military and naval officers and distinguished visitors. It applies also to the governor of a small district, who displays a horsetail as an insignia of rank.

BASHI-BAZOUKS, bâsh'i-bâ-zōōks' (Turk. *bashi*, head, headdress, appearance + *bozug*, spoil, disorderly, from *boz*, to spoil, damage, destroy). Turkish irregular troops; natives chiefly of the wretchedly governed pashalics of Asiatic Turkey, and possessing the worst reputation of any body or class of fighting men in the world. They are wild, turbulent, and wholly undisciplined, more ready to plunder and kill than to fight, and speak a debased Turkish *patois* not easily understood. Physically, they are, as a rule, men of splendid proportions, their tall red fez adding to their apparent height, while the uniform *ensemble*, not unlike the Scottish Highlander, adds to their picturesque appearance. Their equipment consists mainly of a great number of knives and swords, completely loading the waist belt and compelling them to adopt a gait, peculiar to themselves, caused by the necessity of swinging the arms and legs clear of their equipment. Such rifles as they usually possess are of patterns long since obsolete. They are willing to attach themselves to any leader who understands their jargon and who can promise them plunder, and are frequently used by municipal governors depending on pillage and plunder for their pay. It was thought, during the Crimean War of 1854, that they could be usefully employed against the Cossacks, particularly in the sort of irregular warfare usually waged by them. Consequently, in 1855, when the British government took into its pay a Turkish contingent, a corps of Bashi-Bazouks was put under the command of an officer of the British-Indian army. The experiment, so far as the Bashi-Bazouks were concerned, proved a complete failure, as the war ended before they were even partially reduced to discipline. They frequently torture their enemies and mutilate the dead. It is a matter of record that in May, 1876, under the leadership of Achmet Agha, they slew in cold blood over 1000 defenseless Bulgarians who had sought shelter in a church.

BASHI (bâ'shê) **ISLANDS**. A small group

of islands, the northernmost of the Batan group in the Philippines. Bashi Channel separates the islands from Formosa.

BASHKIRS, *bash-kérz'*. A Finno-Tatar people of Mongolian stock (height, 1.650 meters), living in the Orenburg District of Russia, along the slopes of the Urals. They number about 1,000,000 and subsist on their flocks and herds. In faith, the Bashkirs are Mussulmans. Deniker (1900), who terms them "a tribe mixed with Turkish, Mongol, and Ugrian elements," classes them in the central group of his Turko-Tatar stock, along with the Kirghiz, etc. Consult Ujfalvy, *Les Bashkirs* (1880), and Katarinskij, *Dictionnaire bashkire-russe* (Orenburg, 1900).

BASHKIRTSEV, *bash-kért'séf*, MARIE KONSTANTINOVA (1860-84). A Russian artist and writer, one of the most individual characters in the literary annals of the nineteenth century. She was born near Poltava, Russia, and died of inherited consumption in Paris. Her parents were very wealthy and of noble descent, and their daughter, who was gifted with beauty, an unusual voice, and a mind of remarkable maturity, had the advantage of residence in Rome, Nice, Paris, and other cities, where she moved in the highest society. A weakness of the throat, followed by deafness, obliged her to abandon the hope of achieving fame as a singer, and in her seventeenth year she began the study of art in Paris under Robert-Fleury, pursuing it later under Bastien-Lepage until her death, and producing, in spite of her physical disabilities, paintings of rare merit. Her distinctive work, however, was a journal begun in her thirteenth year and faithfully continued through life. It was designed for publication after her death, and intended to be, to use her own words, "the transcript of a woman's life—her thoughts and hopes, her deceptions, weaknesses, good qualities, sorrows, and joys." She herself believed it to be unparalleled in literature, and the same opinion was expressed by Gladstone, one of her many sympathetic reviewers (*Nineteenth Century*, October, 1889). Consult: *Journal de Marie Bashkirtseff* (Paris, 1887) and the full translation of the same (Chicago, 1890); *Lettres de Marie Bashkirtseff* (Paris, 1891), and *Further Memoirs* (London, 1901). The suppressed portions of her diary have appeared in the *Revue des Revues* (1900).

BA/SIC BES/SEMER STEEL PROC'ESS.

See IRON AND STEEL, METALLURGY OF.

BASIDIOMYCETES, *bā-sīd'i-ō-mī-sē'itēz* (*basidium*, see below + Gk. *μύκης*, *mykēs*, mushrooms, fungi). One of the three great groups of true Fungi, second only to the Ascomycetes in number of species, of which approximately 20,000 are known. The group is characterized by the presence of a "basidium," which produces spores ("basidiospores") in a characteristic way. A young basidium is a cell that contains two nuclei; these nuclei fuse, and this fusion is followed by two successive divisions, resulting in four nuclei. In connection with these nuclear divisions cross-walls may form, so that the mature basidium may be four-celled, or it may remain as one cell with four nuclei. Those Basidiomycetes whose basidia are four-celled are called "Protobasidiomycetes"; while those whose basidia are one-celled are called "Autobasidiomycetes." The mature basidium puts out a delicate branch ("sterigma") for each nucleus (or cell), and into the tip of each sterigma a nucleus migrates. The tip of each sterigma is

rounded off to form a spore (basidiospore), which contains the nucleus. Often only two spores are formed, as in the case of the common field mushroom (*Agaricus campestris*), but in this case two of the four nuclei remain in the basidium.

The orders of Basidiomycetes are numerous, but they may be considered under three great groups. The principal forms in one group are the smuts (*Ustilaginales*, q.v.) and the rusts (*Uredinales*, q.v.), which are very different from other Basidiomycetes. They have the four-celled basidium (Protobasidiomycetes), but the chief difference is that the basidium is a separate plant, produced by a spore and producing spores (basidiospores).

The two other groups produce a special structure upon the mycelium (the body of the fungus), in connection with which the basidia are formed. In other words, the basidia are a part of the body and not separate individuals. This special structure is a complex "sporophore," formed by many branches from the mycelium. The numerous orders are distinguished by the character of this sporophore.

In one of the groups the basidia, a layer of which is called the "hymenium," are exposed upon the sporophore. Those orders with an exposed hymenium are called "Hymenomycetes," and the representative and largest order is Agaricales, to which the mushrooms, toadstools, and bracket fungi belong. The ordinary form of the sporophore is the toadstool form, with its stalk ("stipe") and cap ("pileus"); but the bracket-like and hoof-like sporophores are also very common. There are three arrangements for exposing the hymenium: one is to expose it as a layer upon the surface of "gills," and hence the family of "gill fungi" (*Agaricaceæ*); another is to expose the hymenium as a layer lining tubes which open by pore-like openings upon the surface, and hence the family of "pore fungi" (*Polyporaceæ*); the third is to expose the hymenium as a layer upon the surface of tooth-like projections, and hence the family of "tooth fungi" (*Hydnaceæ*). Many of these forms are very destructive to forest trees, the mycelium penetrating the wood and causing various kinds of "rot." They invade the trees either by the spores getting into wounds or by a direct invasion of the mycelium in the soil into the roots of the trees.

In the other group the hymenium is completely inclosed by the sporophore, and such orders are called "Gasteromycetes." The representative Gasteromycetes are the puffballs (*Lycoperdales*). The globular sporophore is differentiated into two regions: a tough jacket ("peridium") and the tissue within ("gleba"). The gleba contains numerous chambers lined with hymenium. So numerous are the basidiospores that when the gleba dries out and the peridium bursts they are puffed out in clouds.

A remarkable order of Gasteromycetes is formed by the "nest fungi" (*Nidulariales*), in which the sporophore opens into a cuplike structure, and the persistent and separated chambers of the gleba are revealed lying like eggs in a nest. The most highly specialized sporophore among Gasteromycetes is that of the "stink horns" (*Phallales*), in which a hollow stalk develops within the gleba and elongating rapidly bursts through the peridium, carrying the chambered gleba at its summit like a cap. The gleba thus exposed deliquesces into a slimy, dripping

mass with the odor of carrion, which attracts carrion flies, by whose agency the imbedded spores are dispersed. See *Plate of FUNGI*.

BASIL, báz'il (Gk. βασιλικός, *basilikos*, royal) (*Ocimum*). A genus of plants of the family Labiate (q.v.). The species are all natives of the tropics, or of the warmer temperate parts of the world, and are generally characterized by a pleasant aromatic smell and taste. Sweet basil (*Ocimum basilicum*) is an annual plant, a native of the East Indies, about 1 foot high, with ovate or oblong leaves, which has long been cultivated in Europe for seasoning food. Bush basil (*Ocimum minimum*) and tree basil (*Ocimum gratissimum*), also natives of the East Indies, are cultivated in gardens for the same purpose. *Ocimum campechanum* is a native of Florida and tropical America. Basil is a common name for *Pycnanthemum*, a North American genus of many species; also of *Calamintha clinopodium* of Europe and North America. *Acinos vulgaris* (now *Calamintha acinos*) is a native British plant known as basil thyme. Basil is used largely as a seasoning herb in southern Europe, and is becoming more common in the United States, as the Greeks and Italians grow it quite commonly.

BASIL I (c.812-886). Byzantine Emperor from 866 to 886, and founder of the Macedonian dynasty. He was of Armenian descent, and when a boy entered the service of Michael the Drunkard (q.v.) as a groom. By his strength and bravery he attracted the Emperor's notice and won his favor. He was promoted rapidly until he was made protostrator. He was the Emperor's boon companion, and after the murder of Bardas, in which he had a share, he was chosen by Michael, in 866, to be his associate in the Empire. The next year Basil, who had obtained a firm control of the government, caused Michael to be murdered. The deed was unrevenged, no party took up the cause of Michael's children, and Basil ruled, until 886, with remarkable ability. Syracuse was lost, but in 878 elsewhere his armies and fleets were successful. At home he reformed the finances, began a recodification of the laws (see *BASILICA*, 2), and worked earnestly to improve administration. He reinstated Ignatius (q.v.) as Patriarch, and sought to end the schism between the Eastern and Western churches; but in this he failed. The Macedonian dynasty ruled at Constantinople for 190 years. Consult Bury, *Eastern Roman Empire* (London, 1912), and Vogt, *Basile I* (Paris, 1908).

BASIL II (957-1025). Byzantine Emperor, the son of Romanus II, at his father's death was only two years old. First his mother, Theophano, then Nicephorus Phocas (963-969), and finally John Zimisces (969-976) ruled the Empire as the guardian of, or co-Emperor with, Basil and his brother. He and his brother Constantine actually became emperors in 976, but Constantine left the government to Basil, who was obliged to carry on almost incessant wars. He suppressed a formidable revolt in Asia Minor in 979, recovered Calabria and Apulia in Italy, and had several conflicts with the Saracens in Sicily. For many years he waged war against the Bulgarians, whom he finally subdued in 1018. Basil, for this victory, won the surname of Bulgaroctonus, "Slayer of Bulgarians." His reign of almost half a century was a period of victory for the Byzantine Empire. Consult Schlumberger, *L'épopée byzantine* (Paris, 1897), and Gibbon, vol. v.

BA'SIL THE GREAT (c.330-379). Bishop of Cæsarea in Cappadocia, founder of Eastern monasticism, theologian, and doctor of the Church. He was born at Cæsarea, of Christian parentage, about the year 330 A.D., and died there, Jan. 1, 379. He is often grouped with his brother, Gregory of Nyssa (q.v.), and Gregory of Nazianzus (q.v.), under the general title of "the three Cappadocians," all being distinguished leaders of Trinitarianism and successors of Athanasius. Basil received a careful education, under such teachers as the rhetorician Libanus, at Constantinople, and Himerius, at Athens. Here (351-355) two of his fellow-students and friends were Gregory of Nazianzus and Julian, afterward Emperor. Returning to Cæsarea, Basil entered with zest into the social life of the city and thus aroused the anxiety of his pious sister, Macrina, who wished him to embrace the religious life. This he was soon led to do. He first visited the famous hermits of Syria, Palestine, and Egypt, and then took up his abode in a picturesque spot on the banks of the Iris, in Pontus, where he gathered a few sympathizers about him and spent several years in severe asceticism. His monastic period falls between 357 and 364. The rule of St. Basil is still the standard of the Oriental monks. It was less systematic than that of St. Benedict (q.v.), which arose later in Italy and controlled the monastic development of western Europe, but it included the characteristic features of monachism, viz., a union of active labor and quiet devotion with strict asceticism.

Basil was made presbyter of Cæsarea in 364. His intense activity and devotion to the people soon gave him an influence greater even than that of the local bishop. He went about establishing new communities of monks and founding hospitals, orphanages, etc. During a particularly severe famine (368) his labors were little short of heroic. All this time his theological position was becoming more clearly defined. He had originally sympathized with the mediating party in the Arian controversy (see *ARIUS*), though his primary interest was not in dogma, but in the practical religious life. But his antagonism to the thoroughgoing Arians led him ever closer to the orthodox side. This attitude aroused hostility, and when the bishopric of Cæsarea became vacant (370), and he was a candidate for the position, there was violent opposition. He was, however, elected, and his administration proved to be vigorous and successful. The office carried with it a virtual primacy of the churches in that part of Asia Minor. He was Metropolitan of Cappadocia and Exarch of Pontus, having many bishops under him, who were often opposed to his policy. But firmness and patience overcame opposition, even from the Arians, his greatest foes. A notable instance of Basil's courage was his withstanding the demands of the (Arian) Emperor Valens, in 372, when, in spite of threats of deposition, the bishop refused to surrender his orthodoxy or grant any favors to heretics. The Emperor is said to have been so impressed by Basil's dignity and courage that he left him in peaceful possession of his see.

As a theologian, Basil ranks below Athanasius and below his brother Gregory. In common with the other Cappadocians he emphasized the trinity rather than the unity of the Godhead. The completed Trinitarian formula asserted one substance (*ousia*) and three persons (*hypostases*).

In the form in which Basil taught this doctrine it laid him open to the charge of tri-theism. One of Basil's greatest disappointments arose from his failure to secure doctrinal harmony between Eastern and Western Christendom. In support of Catholic orthodoxy he was compelled to look toward the West, but his overtures were received with marked coolness at Rome. Pope Damasus never forgave Basil for his failure to recognize the Roman claim to primacy; and Jerome accused him of stubborn pride in thus persistently refusing Damasus due honor. Moreover, Basil's orthodoxy was for a long time under suspicion, for in his early life he had been known to have friends among the Arian heretics. He died before East and West came to an agreement.

Basil was master of a fine literary style. His works include expositions of the Bible, dogmatic, moral, and ascetic treatises, liturgical pieces, and letters. *The Liturgy of St. Basil* is not wholly his work. Some 370 letters are preserved. The best complete edition of his works is the *Benedictine* (3 vols., Paris, 1721-30; reprinted in Migne's *Patrologia Græca*, vols. xxix, xxxii). His chief works are translated into English in the *Nicene and Post-Nicene Fathers*, 2d series, vol. viii (New York, 1895), with valuable prolegomena containing a sketch of his life and an analysis of his works. His most important work, *De Spiritu Sancto*, was edited by Johnston (Oxford, 1892). Consult, in general, Smith and Wace, *Dictionary of Christian Biography*, art. "Basilus of Cæsarea" (London, 1887).

BASILE, bâ-zê'lâ, GIOVAN BATISTA, COUNT OF TORONE (c.1575-1632). An Italian author, born at Naples. His literary productions in the Neapolitan dialect are most valuable. His *Pentamerone ovvero lo cunto de li cunti, trattamento de' peccerille di Giov. Alesio Abbatutis* (Naples, 1634-37), a collection of 50 folk tales resembling in substance the *Hausmärchen* of Grimm and in manner the works of Perrault and Babelais, is one of the most popular books of its kind. It has been translated into various European languages and has been extensively imitated by such artists as Lippi, Salvator Rosa, Carlo Gozzi, and Wieland. Neglected by the author, *Lo cunto de li cunti* was much read in Italy in the seventeenth and eighteenth centuries and became universally famous through the criticism of Grimm and the translation of Liebrecht (1846). Much admired by Sir Walter Scott (1832), the tales have become familiar to English-speaking peoples in the translations of Keightley and Taylor and in the latest of R. Burton (London, 1893). Consult B. Croce, *Studi sulla letteratura italiana del Seicento* (Bari, 1911).

BASILIAN ART. See MONASTIC ART.

BASILIAN ISLANDS. A group of about 60 islands constituting a part of Mindanao, Philippines. They lie off the south coast of the peninsula of Zamboanga, are of volcanic and coral origin, and have a total land area of about 350 square miles. The population is estimated at about 8000. Fishing and a little weaving are the principal occupations. Fruit, sugar, grains, hemp, cotton, tobacco, and fine timber grow. The capital, Isabella, is on the northwest shore of Basilian Island and is about 575 miles from Manila.

BASILIAN MONKS, or MONKS OF SAINT BA'SIL. An order founded by St.

Basil, Bishop of Cæsarea, in 358; it grew to large numbers before the death of the founder (379). The greater portion of the monks of the Greek church are of the order. In the Western church Basilian monasteries existed, and the order became strong after the Reformation in Spain and Italy. A modern Basilian order, founded in France in 1822, devoted to education, has colleges in Canada and the United States. There are also Basilian nuns, who call Macrina, the sister of Basil, their founder. The records of the order show that it furnished 14 popes, many cardinals, and nearly 12,000 martyrs. The rule of Basil is the foundation of that of Benedict, the great founder of Western monasticism.

BASILICA (Lat. from Gk. βασιλική, *basilikē*, royal, scil. *στοά*, *stoa*, porch). The large colonnaded building used by the Romans for the transaction of business and legal affairs; also the common type of the early Christian churches. The name is derived from the *stoa Basileios*, or king's portico, at Athens. Vitruvius (q.v.) says: "Basilicas ought to be built in the warmest quarters of the market places, in order that, in winter, the merchants assembling there may not be inconvenienced by bad weather"; and elsewhere he speaks of the tribunal projected like a hemicycle from the main building, so "that those who stand near the magistrates may not be disturbed by those doing business in the basilica." These buildings varied in proportions and arrangement. Vitruvius, who built one himself at Fanum, says that they should be oblong, their width being between one-third and one-half of their length, and divided into three parts by two rows of columns, the central part being three times as wide as the two sides, which are called porticoes. A second story is made over the porticoes by a second series of shorter columns forming a gallery with a marble parapet, which usually extends also across the short ends and was used for promenaders and spectators. At one of the short ends a tribunal projects in the form of a semicircular or square apse. Here sits the judge, or prætor, surrounded by his assessors or jurymen; it is often partly screened off from

PLAN OF THE OLD BASILICA OF ST. PETER AT ROME.

the main body of the building by smaller columns and is on a higher level. On either side of it is a small room connected with it—cabinet or robing room. There are many variations from the three-aisled type described by Vitruvius. Some are halls with a single nave, without porticoes or galleries, as at Aquino and Palestrina; others—and these the most splendid—have as many as five aisles, with four rows of columns; e.g., the Basilicas Julia and Ulpia; others have two hemicycles, one at each end, as Trajan's Basilica Ulpia; others are virtually

BASILICA
ST. PAUL'S WITHOUT THE WALLS, ROME

square in form, as at Otricoli; others—and these are the majority—have no upper galleries; others, finally, have heavy piers and vaults in place of colonnades and wooden roof, as the colossal Basilica of Constantine. The tribunal end appears to have had a solid wall, but on the other three sides the building was often open, with either a simple colonnade (Ulpia) or a mixed arcade with engaged columns and entablature (Julia) such as we are familiar with in the Coliseum. Some, however, were inclosed by walls on three sides, as the Ulpian, or on all sides, as at Pompeii. For 500 years the Romans built basilicas (c.200 B.C. to 300 A.D.) as one of their most characteristic and sumptuous monumental expressions, alongside of their memorial arches, aqueducts, and *thermae*. Until 184 B.C. their commercial and judicial business had been mostly transacted in the open forum. But in that year the Basilica Porcia was built (burned in 52 B.C.); in 179 the Fulvia; in 169 the Sempronius; in 121 the Opimia; in 46 the Julia. Pliny calls the Æmilia and the Julia two of the four most superb monuments of Rome. They flanked the Forum on opposite sides, and their ruins have recently been studied with great care. Everywhere that Roman colonies were established under the late republic and the Empire basilicas were built in connection with the forums. They were the necessary outward sign of the Roman law, the seat of justice as well as of trade. The earliest basilica in good preservation is that at Pompeii, which has excited the greater interest because it may represent the original Greek type; it has an open porch, five doors, three aisles, a portico across both ends, and a well-preserved, raised, oblong tribunal at one end. Other examples exist: in the Orient, at Palmyra; in Germany, at Treves. In Rome itself the two most famous examples built under the Empire were the Ulpia, erected by Trajan in his forum, and that begun by Maxentius and finished by Constantine, unique for its immense vaulting of tunnel and groin vaults; for all other known basilicas appear to have had wooden roofs except the Ulpian, whose roof was of bronze. It is a common error to suppose that they were roofed only over their side aisles or porticoes with the central space open to the sky; this may, however, have been the case at Pompeii.

The Roman public basilica was therefore a sort of covered forum. The term was, however, extended to other colonnaded halls and porticoes of similar plan, but connected with theatres, baths, temples, and even palaces and villas. The largest room in sumptuous houses, with a higher roofed central section with windows and two rows of columns forming lower side aisles (as in Domitian's palace on the Palatine), frequently served wealthy converts to Christianity in the earliest times as a place of worship.

As the only type of covered structure suitable for large gatherings, it was natural that both the type and the name of the basilica should be adopted for Christian churches. The arrangements suited the requirements of the Christian liturgy. The hemicycle became the apse; the bishop and presbyters sat upon the bema, where the judge and his assessors had been; in place of the altar of a pagan god, the tomb of a martyr or saint stood in front of the bema; the congregation could conveniently be arranged along the side porticoes or aisles—men on one side, women on the other (or, in the East, men below and women in the galleries). The main

change at first was the omission of the cross colonnades across the short ends. Later an atrium (q.v.) was often added at the front, and in some cases a transverse hall or arm intersected the nave in front of the bema (q.v.) or apse. The most splendid examples of the early basilican type of church were the three vast five-aisled basilicas of the fourth century in Rome dedicated respectively to St. Peter, St. Paul (outside the walls), and St. John (at the Lateran), of these the first was demolished (see ST. PETER'S); the second, burned in 1823,

has been reconstructed with great splendor; the third, though standing, has been completely transformed by successive remodelings. The most perfect of early Christian basilicas extant in Rome is that of Santa Maria Maggiore, built in 432 and but little altered. The older (sixth century) portion of San Lorenzo, in two stories, shows the mediæval practice of piecing together unrelated members torn from pagan temples and ruins. The basilica of San Clemente (1096–1108) with a fine atrium, alone preserves the mediæval arrangements and furnishings of the choir, ambones, ciborium, and apse (see these terms respectively). In Italy the primitive type was preserved as late as the twelfth and thirteenth centuries in certain provinces, especially around Rome

PLAN OF BASILICA OF SAN CLEMENTE AT ROME. THE ONLY SURVIVING BASILICA WITH AN ATRIUM.

and in Tuscany, with its oblong plan; two (or four) rows of columns (or very seldom square piers) dividing the nave from the aisles and supporting sometimes a straight architrave; sometimes a row of narrow arches; and thin walls supporting only wooden roofs, with the rafters and frame showing. Sometimes there was a narthex or portico at the entrance, and at the opposite end, in the largest basilicas, a cross-nave intervened in front of the apse, in the centre of which stood the altar. Marble incrustations, mosaic pictures and emblems, and inlaid pavements adorned the finer basilicas. The early basilicas had but a single apse, but by the sixth century a smaller apse was often added on either side, developed from the two side chambers of the ancient basilica, which had become sacristy and treasury in the earliest churches. Until the sixth century the basilican form ruled everywhere; then the Orient adopted Byzantine models, employing the dome, while in the north of Italy in the tenth century under Lombard influence, and later in western Europe generally, the scarcity of antique columns ready-made and of marble, the substitution of heavy clustered piers, large arches, and thick walls for the

serried columns, small arches and thin walls of the basilican type of church, and, above all, the introduction and development of vaulting, completely transformed the aspect of the churches, to which one can no longer apply the adjective "basilican," although they still retain the fundamental elements of the basilica plan. (See ROMANESQUE ARCHITECTURE.) Besides the important basilicas already mentioned one may note from the early period Santa Sabina and Sant' Agnese at Rome; Church of the Nativity at Bethlehem; Sant' Apollinare Nuovo, Sant' Apollinare in Classe, San Francesco, and San Vittore at Ravenna; St. John at Constantinople; St. Demetrius at Salonica, the Crocifisso at Spoleto; the cathedrals at Parenzo, Trieste, and Grado. In central Syria, where there are remarkable ruined Christian towns deserted ever since the Mohammedan invasion in the seventh century, there are important basilicas at Shakkā, Tafka, Sueideh, Kerbet-Hass, Rueiha, Der-Seta, Bakuza, Kalb-Luzeh, Turmanin, Kalat-Seman, etc. Of later date are the following at Rome: San Giorgio in Velabro (682), Santa Prassede (ninth century), Santa Maria in Trastevere and the nave of San Lorenzo (twelfth century); and elsewhere San Miniato at Florence, cathedrals at Torcello and Murano, and two churches at Toscanella, besides many others which combine basilican and Romanesque elements in varying degrees. See CHURCH; Plate of PAESTUM.

BASILICA (Gk. neut. pl. of βασιλικός, *basilikos*, royal). A legal code published by Leo VI of the Byzantine Empire at the close of the ninth or the beginning of the tenth century. Its name is equivalent, in the opinion of some, to imperial law; but others think it was given in honor of Basil, the father of Leo, who began the work. It was composed of 60 books. The materials used were Greek translations of the *Corpus Juris Civilis* of Justinian, commentaries on the *Corpus*, and some later laws. In it the influence of Christianity is very marked, especially with regard to family relations. The best edition is Heimbach: *Basilicorum Libri LX Gr. et Lat.* (6 vols., Leipzig, 1833-70), completed by Zachariæ von Lingenthal, who published the *Prolegomena* in 1846 and a supplement in 1870. But only about two-thirds of the whole work are extant. Consult Heimbach, "Griechisch-römisches Recht," in Ersch and Gruber, *Encyklopädie*, part lxxxvi, and Mortreuil, *Histoire du droit byzantin* (3 vols., Paris, 1843-47).

BASILICA ÆMILIA. The finest basilica of Rome, built by L. Æmilius Paulus in 54 B.C. at a cost of \$2,400,000, supplied by Cæsar, for the purpose of enlarging the Forum. It stood on the north side of the Forum near the Curia, or Senate House. After a fire it was restored in 14 B.C. at the expense of Augustus, and adorned with splendid columns of Phrygian marble, which were later set up in St. Paul's without the Walls and destroyed by fire in 1823. Within the last 10 years much of the building has been excavated (consult Hülsen-Carter, *The Roman Forum*, Rome, 1906). The building whose ruins are now visible was on the site of an older structure, known as the Basilica Fulvia et Æmilia, begun in 179 B.C., by M. Fulvius Nobilior and M. Æmilius Lepidus.

BASILICA JULIA. A great basilica on the south side of the Roman Forum, begun by Julius Cæsar in 54 B.C., and opened after the battle of Thapsus in 46 B.C. It was several times destroyed by fire and rebuilt. Its walls were of

solid marble, and the pilasters which divided its nave and four aisles were of travertine sheathed with marble. The eastern end is crossed by the Cloaca Maxima. In the Basilica Julia the sessions of the Court of the Centumviri (q.v.) were held. In the sixth century the western vestibule was made into the church of Santa Maria de Foro; in the eleventh, rope makers took possession of it; and in the fifteenth century it was given over to lime burners, who set up in it their kilns and turned its marbles into lime. Later, it was used as a hospital burying ground, which covered its surface with a layer of human bones 6 to 8 feet deep. The basilica, like other buildings, has from time to time been despoiled of its materials, which have been used in the construction of other edifices, and the remains at the present time represent chiefly modern restorations. Consult Hülsen-Carter, *The Roman Forum* (Rome, 1906).

BASILICA OF CONSTANTINE. See CONSTANTINE, BASILICA OF.

BASILICA PORCIA, pōr'shī-ā. See BASILICA, 1.

BASILICA ULPIA. See BASILICA, 1.

BASILICON (Lat. from Gk. βασιλικόν, *basilikon*, a black plaster, properly neut. of βασιλικός, *basilikos*, royal, i.e., of great virtue). A name given to an ointment composed of yellow wax, black pitch, resin, and olive oil or lard. The ointment has also been called *unguentum tetrapharmacum* (from the Gk. τέτταρα φάρμακα, *tettara pharmaka*, i.e., four drugs). Basilicon ointment, or resin cerate, as it is otherwise known, is used as a gently stimulant application to ulcers, burns, scalds, chilblains, and boils.

BASILICON DŌRON (Gk. βασιλικὸν δῶρον, *basilikon dōron*, royal gift). The title of a treatise written by James VI of Scotland (afterward James I of England) for the instruction of his eldest son, Prince Henry, who died before his father. It was first printed in 1599. The work is divided into three books, which treat severally of a king's duty toward God, his duty in his office, and his duty in indifferent things. In the first book is laid down the divine right of kings, a doctrine whose practical application proved so disastrous to the Stuarts.

BASILIDES, bās'ī-lī'dez (Gk. Βασιλειδῆς, *Basileidēs*). A famous Gnostic Christian of Alexandria, who flourished during the reign of Hadrian (117-138 A.D.). Few details of his life are known. We are told, on doubtful authority, that he was a pupil of the heretical Menander at Antioch, and that he taught in Persia, where his dualistic system was later revived by Mani (see MANICHÆISM). Basilides himself claimed to be a follower of one Glaucias, "the interpreter of Peter," but no such person is known to us from any other source. The otherwise unknown prophecies of Barkabbas and Barkoph, to which Basilides refers, have been conjectured to be apocryphal Zoroastrian books. Basilides wrote a Gospel commentary, called the *Exegetica*, in 24 books. Origen speaks of a "Gospel according to Basilides," but it is improbable that Basilides did more than edit some kind of a gospel for the use of his followers. He shows some acquaintance with material included in our Matthew, Luke, and John. His son Isidore wrote several books, three of which are mentioned by Clement of Alexandria, and from others of the Basilidian school there come various incantations and odes: None of these writings are known to us except through opponents of the

movement. Agrippa Castor was one of the first to attack Basilides, but his book has perished. Irenæus, Clement of Alexandria, Hippolytus, and Origen discuss Basilides' doctrine at some length, but they do not agree in their accounts of what he taught. Following their divergent opinions, some modern scholars hold that Basilides constructed his system on Greek models, especially Aristotle; others, that he drew from the Orient, especially from the Persian dualism of Zoroaster. Criticism inclines at present towards the latter view.

Basilides' teaching should be studied in comparison with that of other Gnostics. (See GNOSTICISM.) He taught an elaborate cosmology, a system less perhaps like emanation than like evolution from the great Original. Basilides' system was not acceptable to the Church at large and was pronounced heretical. His followers, however, were quite numerous, and we hear of them as late as the fourth century, although they never attained any importance outside of Egypt. An illustration of how widely the Basilidians departed from the principles of their founder may be drawn from the fact that some of them practiced a gross licentiousness, while Basilides was inclined toward asceticism.

Bibliography. Uhlhorn, *Das basilidiansche System* (Göttingen, 1855); Mansel, *Gnostic Heresies*, ed. Lightfoot (London, 1875); Hort "Basilides," in Smith and Wace, *Dictionary of Christian Biography* (London, 1887); Schaff, *History of the Christian Church*, vol. ii, pp. 466-472 (New York, 1891). See GNOSTICISM.

BASILIO DA GAMA, bà-zêl'yô dâ gã'má, JOSÉ. See GAMA, JOSÉ BASILIO DA.

BASILIS/CUS (Gk. *Βασίλειος*, *Basiliskos*). Emperor of the East from 476 to 477. He was brother-in-law of the Emperor Leo I. In 468 he had led the great African expedition against Genseric, the Vandal, which ended disastrously. His reign was uneventful. He was deposed by Zeno in 477 and died the following year.

BASILISK, báz'l-isk (Gk. *Βασίλειος*, *basiliskos*, dimin. of *βασιλεύς*, *basileus*, king; Lat. *regulus*, little king; so named, according to Isidor, because it was the king of serpents, but perhaps by reason of the crest on its head). A fabulous creature, resembling a serpent, and supposed by the ancients to inhabit the Libyan Desert. It was described as being of a yellowish color, with spots of white, and as having a pointed head, whereon stood one or more prominences, also white, resembling a diadem. Its breath was considered to be especially poisonous and its glance fatal. The word *basilisk* is now applied to a sort of lizard, having an erectile crest along the middle of the back and tail and a dilatable pouch on the head.

BASILIUS, JOHANNES. See BESSARION, JOHANNES.

BASILIUS VALENTINUS. See VALENTINUS, BASILIUS.

BA/SIN (OF. *basin*, from LL. *bachinus*, from *bacca*, water vessel). In geology and hydrography, a depression of the earth's surface or of the strata constituting the crust of the earth; also the drainage area of a river system. Basins originate in several ways, and may be grouped under two general heads, those formed by crustal movements and those due to erosion. Most basins are due in part to both agencies. Basins formed by movements of the earth's crust are apt to be of great extent according as they owe their origin to either localized or continental

movements. The Mississippi valley, previous to Tertiary time, was occupied by a shallow arm of the sea that covered the central portion of the North American continent. Elevation of the continent raised the district above sea level and drained the marine waters from the land, and orogenic movements partially surrounded it with mountains, with the result that an extensive interior basin was formed, the larger part of which is now drained by a single river system, that of the Mississippi. Other portions of the same basin are drained by the St. Lawrence River and by the rivers that flow into the Arctic Ocean. We have here an example of a geologic basin that contains several hydrographic basins.

The inclosed basins of Utah, Nevada, Arizona, and Mexico have been formed by local movements, folding, and faulting of the crust, that have culminated in the elevation of mountains inclosing plains. The elevation of the mountains has cut these plains off from the supply of moisture-laden winds, and arid desert conditions have largely ensued. During a former more humid period in Pliocene time great lakes occupied many of these basins, but their waters have disappeared largely through evaporation and lack of supply by rains, and concentrates of alkali, salt, and gypsum now cover large areas of their desert bottoms, while traces of their former shore lines are to be found far up on the mountain sides. See LAKE BONNEVILLE; LAKE LAHONTAN; GREAT SALT LAKE.

Another form of basin results when a section of the earth's crust subsides between two nearly parallel great faults or dislocations, to form what is known as a "rift valley." The most striking basins of this kind are found in western Asia and eastern Africa. The largest basin in this region begins north of the Dead Sea, and extends southward through the valleys of the Dead Sea, the river Jordan, and the Red Sea, whence the rift is continued in a southerly direction across Eritrea in Africa, to a point near Mount Kilimanjaro. This may be considered a continuous single depression or rift-valley basin, with a length of about 3500 miles and a maximum width at the Red Sea of 200 miles. Another such depression extends westward of the Victoria Nyanza for nearly 1500 miles in a general southerly direction and includes the valleys of the Albert Nyanza, Tanganyika, and Nyassa, terminating at the coast in the vicinity of the mouth of the Zambezi River. The amount of displacement of the bed of this latter rift has been enormous, the vertical throw of the faults having been at least 5000 feet in the vicinity of Lake Tanganyika. In volcanic regions basins filled by lakes often occur in the craters of extinct volcanoes. Crater Lake, in Oregon, is a good example.

In coal-mining regions the term "basin" is applied to synclinal depressions of the coal-bearing strata that have been produced by the folding of the beds incident to their elevation into mountains. Such a stratigraphic basin in the crust of the earth is not usually coextensive with a hydrographic basin on the surface, for the reason that synclinal depressions generally occupy ridges. The anticlinal upfolds have been worn away by weathering and are now replaced by valleys or hydrographic basins.

Basins formed by erosion are of two kinds, those formed by the work of rivers and those due to the wearing action of glacier ice. The former are the larger and more common, though the

latter often constitute prominent features of the landscape of northern countries. The basin of a river, when considered hydrographically, consists of the entire area drained by the main stream and its tributaries. This hydrographic basin may be in large part the result of orogenic movements; but its present boundaries have been determined entirely by the cutting power of its streams, and accordingly a hydrographic basin may consist of one or more geologic basins. The Hudson River system furnishes a good example of such a complex basin. The lower Hudson River, from New York City to Peekskill; the upper Hudson, from Peekskill to the Adirondacks; the Schroon River in the Adirondacks; the Mohawk River; the Schoharie, Esopus, and Catskill creeks, in the Catskill Mountains; and the Rondout in the Shawangunk Mountains—all drain distinct geological basins, the divides between which have been cut down by the rivers, till now the entire region is included in a single hydrographic system.

Glacial basins have been formed by the eroding power of ice acting on the floor and sides of valleys already formed by some other means. The basins usually hold lakes that form parts of river basins. Such are the "finger lakes" of central New York. Round lakes occupying shallow, bowl-shaped depressions on glaciated surfaces are common. A basin may also be formed when a landslide or moraine obstructs a valley. Such a basin and its contained lake is of an evanescent character, the extent of its duration depending upon the rate at which the overflow can cut down or remove the obstruction.

Basins tend in time to become shallower through the accumulation upon their floors of debris worn from the surrounding mountains. This process would, if continued without interruption, eventually fill the basin to its brim with deposits of gravel, sand, and silt, and a plain would result which, under conditions of sufficient moisture, would be of great fertility. Such waste-filled basins are common in the Pacific States. The discussion of the origin and characteristics of oceanic basins is reserved for the article on OCEAN. See also RIFT VALLEY; LAKE; RIVER; HYDROGRAPHY; PHYSIOGRAPHY.

BASINGSTOKE, bā'zīng-stōk (stock or place belonging to the Basings). A market town and railway junction in Hampshire, England, 48 miles by rail southwest of London, at the junction of five main roads from the south and west of England to the metropolis, and on the Basingstoke Canal, which connects it with the rivers Wey and Thames (Map: England, E 5). It has a handsome parish church, townhall, municipal corn exchange, and owns its water works, markets, and cemetery. The chief trade is in corn, malt, coal, and timber, and it has manufactures of agricultural implements, clothing, malt liquors, etc. In the neighborhood are the ruins of Basing House, belonging to the Marquis of Winchester, which withstood the forces of the Commonwealth for four years, but was at last taken by Cromwell and burned to the ground in 1645. Pop., 1891, 8200; 1901, 9800; 1911, 11,540.

BASKERVILLE, JOHN (1706-75). A noted English printer, born at Wolverley, Worcestershire. Originally a footman, he afterward became successively a stonecutter and a writing master, and from 1740 manufactured japanned ware with much success at Birmingham. There, in 1750, he began costly experiments in type founding and, having obtained a satisfactory

letter, published in 1757 his quarto *Vergil*, ranked by Dibdin (*Introduction to the Knowledge of Editions of the Greek and Latin Classics*, 1827) among the "most finished specimens of typography." In 1758 he was appointed for 10 years printer to the University of Cambridge, in which capacity he executed (1763) his famous edition of the Bible. From 1770 to 1773 he imprinted the splendid series of Latin classics. His type, not unqualifiedly praised by contemporaries, is now much admired. He manufactured his paper and devised a method of preparing a rich and uniform ink. Specimens of his work are now very scarce and valuable. Among his friends was Benjamin Franklin, with whom he corresponded regarding the sale of type-founding and printing establishments to the French government.

BASKET (Lat. *bascauda*, an article of furniture, made of basket work; probably of Celtic origin; cf. Welsh *basged*, *basgawd*). A vessel made of willow, thin strips of wood, reeds, grasses, or similar flexible materials woven together in a great variety of forms and used for many different purposes. Baskets have been in use from the very earliest times. The first mention of baskets in the Bible is in connection with the interpretation of Pharaoh's dreams by Joseph, and specimens of coiled basketry have been dug up from near Abydos in middle Egypt that are over 6000 years old. Remnants of baskets have been obtained from the Swiss lake dwellings, and similar finds are had from the remains of prehistoric peoples in America. There are two distinct types of technic in basketry: (1) *hand-woven* basketry which is built on a warp foundation, and (2) *sewed or coiled* basketry, which is built on a foundation of rods, splints, or straws. According to Mason, woven baskets are of (1) checkerwork—the warp and the weft having the same width, thickness, and pliability; (2) diagonal or twilled basketry—two or more weft strands over two or more warp strands; (3) wickerwork—inflexible warp; slender flexible weft; (4) wrapped weft, or single weft wrapped—the weft strand is wrapped, or makes a bight about the warp at each decussation, as in the Mohave *Kiho*; (5) twined or wattled basketry—weft of two or more elements. He divides coiled basketry into (1) coiled work without foundation; (2) simple interlocking coils; (3) single-rod foundation; (4) two-rod foundation; (5) rod and weft foundation; (6) two-rod and splint foundation; (7) three-rod foundation; (8) splint foundation (9) grass-coil foundation; (10) Fuegian coiled basketry. Basketry is studied from the point of view of materials. These naturally vary with the locality, for some plants are to be found only in certain localities; thus among the Chinese and Japanese bamboo is the chief stock used. Baskets are frequently ornamented with animal products, as fur and feathers, and sometimes with minerals. The manufacture involves the harvesting of the materials, their preparation, and the various processes of weaving, tools used, etc. The ornamentation is an important item, and the study of the symbolism shown in the designs is an important source of information, serving certainly in the United States as a key to Indian lore. Baskets are used in food, dress, house, furniture, arts, and industries, as expressions of aesthetic culture, in social customs, and religion. According to Mason, "from the cradle to the grave they are present." Their distribution is

HOPI, ARIZONA

HOPI, ARIZONA

MARICOPA, ARIZONA

world-wide, and they have developed wherever the environments furnished the necessary materials. In the eastern United States only traces of early basketry remain except perhaps in the beautiful Chetimacha specimens of Louisiana, but among the Western Indians, notably the Apaches, the art of basket making is still extensively practiced, and perhaps even more conspicuously among the Indians of the Pacific slope, yielding the Klikitat, Hupa, Pomo, and Tulare baskets. The great interest in the art of making baskets has in recent years led to their manufacture by amateurs, and the subject is now taught in most arts and crafts schools. Unfortunately not always wisely for aboriginal designs and forms tend under such circumstances to disappear and lose their original significance. The great museums of the world have collections of baskets, and in the United States those at the National Museum in Washington and in the American Museum of Natural History in New York are worthy of mention. There are also many private and special collections. For the ordinary commercial utensils of this kind the materials most extensively employed are thin split strips of ash and oak, willow and rattan. Consult *Directions for Collectors of American Basketry* (Washington, 1902) and *Aboriginal American Basketry: Studies in a Textile Art without Machinery* (1904), both by Otis T. Mason, and *Indian Basketry*, by George Wharton James (Pasadena, 1901).

BASKET BALL. A game that may be played on any ground or floor on which an oblong space not exceeding 4000 square feet can be marked. The goals, at each end of the floor or field, are hammock nets of cord, suspended

from metal rings 18 inches in diameter (inside) at a height of 10 feet above the ground in the centre. The ball is a round, inflated bladder, covered with leather, from 30 to 32 inches in circumference, and weighing from 18 to 21 ounces. The game is played in halves of 20 minutes (actual play) between teams of 5 players each (a left and a right guard, a centre, and a left and a right forward). The teams change baskets at the end of the first half. The ball is put in play by being thrown by the referee into the centre of the field at right angles from the side lines and to a greater height than either of the centres can jump. The players who are to jump for the ball must keep their feet within the two-foot circle shown on the diagram. Each team endeavors to throw the ball into the basket of the other and to prevent its opponents from making a similar goal. The ball must be thrown, batted, or held with the hands only. It may not be kicked, punched or carried. Not more than one player on either side shall touch the ball at the same time. A player may not tackle, hold, push, shoulder, kick, or hack an opponent, and

intentional roughness will disqualify. The penalty for these and other offenses gives the opposing team a free throw for the basket from a distance of not less than 15 feet. A goal so made counts one point; an ordinary goal from the field, two points. The foregoing are the principle regulations for the game as commonly played by men, though there are also Intercollegiate Rules, used chiefly by men, and Rules for Women (adopted in 1899) which provide for some modifications of the usual game.

The game is regulated by the Amateur Athletic Union, which has drawn up the official rules for its practice. It enjoys the unique distinction of having been invented by a single brain at one sitting. In 1891 a lecturer on psychology in the training school of the Young Men's Christian Association at Plainfield, Mass., speaking of the mental processes of invention, proposed the example of a game with its limitations and necessities. The same night, James Naismith, a member of the class, worked out basket ball as an ideal game to meet the hypothetical case; and the next day in the lecture room it was put in practice with the aid of the members of the gymnastic class. Thence it spread to other branches of the Young Men's Christian Association, and in two or three years to other athletic clubs and to the general public. Consult *Spalding's Official Basket Ball Guide for 1913-14* (New York, 1913); also Dudley and Kellor, *Athletic Games in the Education of Women* (New York, 1909), and Hill, *Athletic and Out-Door Sports for Women* (New York, 1903).

BASKET FISH. A group of echinoderms of the same class (*Ophiuroidea*) as brittle stars, but of the genus *Astrophyton*, characterized by dichotomously branched arms, in some species so numerous subdivided that when they are curled up the creature seems inclosed in a basket. The five-sided disk varies in size with age and species, but may be 3 inches broad, while the arms may be 10 to 15 inches in length. The upper side of the disk has 10 radial ribs, bearing short, blunt spines. The animal is wholly covered with an epidermis, granulated above, but smooth beneath, except that it seems to have a double line of stitches under each arm. The general color is light buff; but the interbranchial spaces in the living animal vary from dark purple to bright pink. The mouth is on the under side and central, and is set with spiniform bristles hiding numerous thorn-like teeth. From around the star-shaped mouth branch 5 stout arms, each of which is divided at the edge of the disk. Each of these 5 main branches is divided into two, making 10; each of the 10 is divided, making 20, and so indefinitely down to the least visible filament. An English naturalist counted 81,920 of these "small sprouts, twigs, or threads" in one species. On capture or disturbance the creature instantly folds its arms closely about its body, shrinking from the touch like a sensitive plant and assuming the basket shape from which it gets its familiar name. The attempt to untwist these coils generally ends in breaking the delicate but tenacious threads. The basket fish is probably a vegetable feeder, and its peculiar arms serve possibly for its protection from its enemies. The microscope shows each arm and spine to terminate in a minute but sharp hook. The animal, in moving, lifts itself on the extreme end of its long arms, standing as it were on tiptoe, so that "the ramifications form a kind of trellis work all around it reaching to the

ground, while the disk forms the roof." A number of species of basket fish are known; perhaps a dozen are valid. They are found in moderately deep water in most parts of the ocean, especially in the tropics, though the best-known species are of the north Atlantic. See BRITTLE STARS.

BASKET WORM. See BAGWORM.

BASKING FISH, or BASKING SHARK. See SHARK.

BASLE, bäl. See BASEL.

BASNAGE DE BEAUVAL, bá'názh' de bó'-vál', JACQUES (1653-1723). A French statesman and writer on theology; the most distinguished of a French family known as supporters of the Protestant cause. In 1709 he settled as stipendiary minister of the Walloon church in The Hague, having gained the friendship of the Grand Pensionary, Heinsius. Here, while zealously discharging his religious duties, he was called upon to take an active part in state affairs, particularly in negotiating the defensive alliance concluded between France, England, and the States-General, Feb. 14, 1717. He died at The Hague, Dec. 22, 1723.

His chief works, which have been frequently laid under contribution without being named, are: *La communion sainte* (1688), a work approved even by Roman Catholics and often reprinted; *Traité de la conscience* (2 vols., 1696); *Histoire de l'Eglise* (2 vols. fo., 1699), in four parts, of which the fourth reprints his *Histoire de la religion des églises réformées* (2 vols., Rotterdam, 1690, 3d ed., 1725). It was a Protestant reply to Bossuet's *Variations of Protestantism*, to show that Protestantism is the true successor of the Apostolic Church; *Histoire des Juifs* (5 vols., 1706), one of Basnage's best productions and translated into English by Th. Taylor (1708); *Dissertation historique sur les duels et les ordres de chevalerie* (1720). Consult his *Life* by E. A. Mailhet (Geneva, 1881).

BASOCHE. See BAZOCHE.

BASQUE, hásk (Fr. *Biscayan*, Lat. *Vascones*, whence Fr. *Gascons*, ML. *Biscaini*, *Busci*, Basque *Fuskaldun* or *Eskalkun*). An isolated language of southern France and northern Spain, of entirely unknown affinities, spoken by about 440,000 persons. It is most plausibly supposed to be the sole representative of the ancient Iberian languages, which were superseded by Latin when the Romans conquered Spain and Gaul. In structure Basque belongs to the so-called polysynthetic or agglutinative type of languages, since it incorporates into the verb the pronominal elements for subject and object. In this respect it bears a marked resemblance to certain dialects of the Caucasian group and even to some North American Indian languages. All attempts to trace a real connection, however, between Caucasian and Basque have thus far proved unsuccessful, while parallels between Basque and American Indian are probably to be regarded merely as accidental coincidences. The late Georg von der Gabelentz sought to trace an affinity between Basque and the Berber dialects, but this theory also is open to grave doubts. It seems safest, in the present stage of linguistic knowledge, to regard this language as forming a family by itself.

Basque is divided into several dialects, of which the chief are those of Guipúzcoa, Biscay, Labourdin, and lower Navarre, all of which adopt the Roman alphabet, conforming their orthography to either the Spanish or the French, according to their position south or north of the

Pyrenees. Basque words are accented, as a rule, on the final syllable, which ends in a vowel, or in *s, r, l, n*, and once in *t*. It possesses nouns, adjectives (which have no radical affinity with the nouns), pronouns, and verbs. Grammatical gender is lacking, while the verb, like the Germanic, has, properly speaking, but two tenses, present and past. The noun has two numbers and seven cases—nominative-accusative, instrumental, genitive, dative, locative, sociative (*gison-are-kin*, 'with the man'), and caritive (*gison-a-gabe*, 'without the man'). The article, originally, as in Indo-Germanic, a demonstrative, stands between the noun stem and the flectional ending (*gison-a*, 'the man'; genitive, *gison-ar-en*; dative, *gison-ar-i*). Similarly the adjective, which follows the noun, alone receives inflection (*ur garbi*, 'pure water'; genitive, *ur garbi-ar-en*). The Basque verb is either transitive, in which case the object can never be omitted, or intransitive, and both classes are strong or weak according to the absence or presence of the auxiliary verb. In the intransitive verb the subject precedes, while the order of the transitive is object, verb, subject (*h-a-bil*, 'thou goest'; but *h-a-kar-t*, 'thou bearst'). The substantial agent of a transitive verb is denoted by the instrumental (*gison-a-k yan du*, 'the man has eaten it'; literally, 'by the man was its eating'), forming a curious partial analogy to the usage in many modern Indo-Iranian languages as well as in the Australian dialect of Encounter Bay. In addition to the indicative mood the verb has an optative and an imperative. The rather meagre tense system of the Basque is supplemented by a future and a future perfect, nearer and remoter perfect, as well as pluperfect by analogical influence from the Romance languages, as *ibili-ko n-ais*, which is almost exactly equivalent to the English *I have to be a-going*, or the French *irai*, 'I have to go,' from Lat. *ire habeo*. The numerical system, as in the Central American languages, is primarily vigesimal. Basque literature is not extensive and is mostly of a popular character, poems, quasi-dramatic compositions somewhat resembling the mystery plays of the Middle Ages, and the like, together with translations of religious literature. The oldest Basque book that we know, the *Langue vasconum Primitia*, is a collection of mediocre religious poems and love poems, and dates from 1545. The earliest-known Basque of distinction who wrote in his own language was Pedro de Axúlar, who flourished about the middle of the seventeenth century and wrote on religious subjects. Although it has adopted numerous loan words from French and Spanish, it has maintained its own remarkably against its Romance neighbors.

Consult: Müller, *Grundriss der Sprachwissenschaft*, vol. iii (Vienna, 1887), where an excellent summary of Basque grammar is given; Gerland, "Die Basken und die Iberer," in Gröber, *Grundriss der romanischen Philologie*, vol. i (Strassburg, 1892-98; 2d revised and enlarged ed., Strassburg, 1904-06, with rich bibliography); Rev. Wentworth Webster, *Basque Legends, with an Essay on the Basque Language* by M. Jul. Vinson (London, 1877); Julien Vinson, *Le folklore du pays basque* ("Les littératures populaires de toutes les nations," vol. xv, Paris, 1883); Mahn, *Denkmäler der baskischen Sprache, mit einer Einleitung über das Studium derselben* (Berlin, 1857); De Azcua, *Euskal Izkendea; Gramática euskara formada y traducida* (Bilbao, 1891), Basque and Spanish; Van Eys, *Dictionnaire*

basque-français (Paris, 1873); Van Eys, *Grammaire comparée des dialectes basques* (Paris, 1879); Van Eys, *Outlines of Basque Grammar* (London, 1883); Vinson, *Essai sur la langue basque par François Ribéry, traduit du hongrois* (Paris, 1877); *Essai d'une bibliographie de la langue basque* (Paris, 1891); Campion, *Gramática de los cuatro dialectos de la lengua euskara* (Toulouse, 1884); Aizquibel, *Diccionario basco-español* (Toulouse, 1882-85); Larramendi, *Diccionario trilingue Castellano, Bascuence y Latin* (2d ed., 2 vols., San Sebastian, 1853); Michel, *Le pays basque, sa population, sa langue, ses mœurs, sa littérature et sa musique* (Paris, 1857); Linschmann and Schuchardt, *Leizarraga's Baskische Bucher von 1571, Neues Testament, Kalender, und Abc, im genauen Abdruck* (Strassburg, 1900); Lewy d'Arbatiague, *De l'origine des basques* (Paris, 1896, reprinted from *La Nouvelle Revue*, Dec. 15, 1895).

BASQUE PROVINCES. A division of northeast Spain, containing the provinces of Vizcaya (Biscay), Guipúzcoa, and Álava. The total area is 2739 square miles. The surface is very mountainous, particularly in the province of Álava, which is everywhere cut up into deep, narrow valleys by offsets from the main chain of mountains. The rivers of Vizcaya and Guipúzcoa empty, after a short course, into the Bay of Biscay; those of Álava flow down the opposite slopes into the Ebro, which carries their waters to the Mediterranean. The climate is, on the whole, mild and salubrious. The general aspect of the country is very picturesque, the hills in most cases being covered to the summit with forests of oak, beech, and chestnut. The soil in the valleys and plains, while not very rich, has been rendered productive by the energy of the people, although agricultural methods in the heart of the Basque Provinces are of the most primitive kind. The farms are small, usually of only about four or five acres, and rarely more than can be managed by the farmer and his family. The products are wine, barley, maize, flax, hemp, and some wheat. Iron is found in abundance (output, 1905, 5,302,344 tons, nearly all from Vizcaya); also copper and tin, marble, porphyry, and jasper. The sea fisheries are productive. *De facto* pop., 1900, 603,596; census of Dec. 31, 1910, 673,788 (*de jure*, 672,884). Consult Whiteway, "Customs of the Western Pyrenees," in *English Historical Review* (London, 1800), and Fabié, *Estudio sobre la organización y costumbres del país vascongado* (Madrid, 1897).

BASQUE RACE. The Basque race is of mixed physical type, with considerable variety in stature, color of hair, eyes, etc. Two types of skull are distinguished—brachycephalic or sub-brachycephalic, among the French Basques, and mesocephalic, or sub-dolichocephalic, among those of Spain. The Basque race is not confined to the Basque Provinces or to the southern side of the Pyrenees. On the French side of the Pyrenees, three cantons of the department of Basses-Pyrénées, i.e., Labourd, Basse-Navarre, and Soule, are inhabited by Basques.

The Spanish Basques are a simple, brave, and independent people, willing to undergo any hardships rather than surrender their mountain freedom. No invader was ever able effectually to subdue or to expel them. The Basque Provinces retained, until 1876, a separate constitution guaranteeing them many political and fiscal privileges not possessed by the rest of

Spain. (See FUERO.) But on the suppression of the Carlist insurrection, which had its stronghold in the Basque Provinces and in Navarre, the old immunities were abolished. The Basques are even prouder than the Spaniards, and the mere fact of being born in their territory secures the privilege of "universal nobility." *Escualdunac* is the name the Basques give themselves, a word which has been taken to mean either "caters of acorns" or "dwellers in oak forests," but which signifies "those who speak *Eskuara*." Their country they call *Escualeria*; and their language, which is peculiarly their own, *Eskuara*. The language has many dialects (as many as 25 have been noted by some authorities), but they can be grouped under three or four heads. The Basques are among the people to whom the curious custom of the "couvade" (q.v.) has been attributed.

The Basques are generally considered to be a variety of the Mediterranean branch of the white race, but their language is distinctly non-Aryan and forms an independent family of speech, no connection with any other tongue having yet been proved to exist. Finck, in his *Die Sprachstämme des Erdkreises* (Leipzig, 1909) voices a common opinion of ethnologists in stating (p. 43) that "Basque is the descendant of the ancient Iberian, or a dialect of it," but it has a considerably Aryan (French-Spanish-Latin) element. The relation of the Basques to ancient Iberian culture, and to the Celtic element in the Spanish Peninsula has not yet been determined.

There are at present about half a million Basques in Spain and France, three-fourths of whom are in the Basque Provinces. It is said that in addition to these some 200,000 Basques emigrated during the last half of the nineteenth century to South America, to which they have contributed a most desirable element in the population ever since the beginning of Spanish America, on account of their great bodily strength, good habits, and industry. Many eminent Spaniards have come from the Basque Provinces, the most noted being Ignatius Loyola and St. Francis Xavier. For a more particular account of the Basque race, consult: Vinson, *Les Basques et le pays basque* (Paris, 1882), the same writer's *Le folk-lore du pays basque* (Paris, 1883), and *Essai d'une bibliographie de la langue basque* (Paris, 1891); Collignon, *La race basque* (Paris, 1895); De Aranzadi, *El Pueblo Euskalduna* (San Sebastian, 1889), and other works; Webster, *Basque Legends* (1877); Marrast's edition of the Humboldt, *Recherche sur les habitants primitifs de l'Espagne* (Paris, 1866); Hübner, *Monumenta Linguae Ibericæ* (Berlin, 1893); Michel, *Le pays basque* (Paris, 1857); and Baudrimont, *Histoire des Basques* (Paris, 1867). For a résumé and critique of the more recent literature on the Basque question, consult Schuchardt's article, "Zur gegenwärtige Lage der baskischen Studien," in *Anthropos* for 1911. On the archæological side consult also Siret's *Questions de chronologie et d'ethnographie ibériques* (Paris, 1913).

BASRA, bās'rā, **BUSRA**, bū'srā, or **BAS-SORA**, bās'so-rā (Pers. and Ar. *Basrah*, fortress). A town of Asiatic Turkey, the capital of the easternmost vilayet of the same name (area, 53,591 square miles; pop., 433,000), on the Ashar or Basra Creek, about 3 miles from its confluence with the Shat-el-Arab, 60 miles from the Persian Gulf (Map: Turkey in Asia, M 7). Situated at

the head of navigation, Basra is the centre of transshipment from river boats and caravans to ocean steamships and is therefore a place of great commercial importance. It is the port of Bagdad and has regular steamer communication with Europe and Indian ports. The chief imports from India are coffee, indigo, rice, wood, and drugs; and from Europe, and especially Great Britain, manufactured articles. The surrounding country is very fertile and yields vast quantities of fruit. This is one of the leading ports in the world for the export of dates, and upward of 60,000 tons are shipped annually. The town is surrounded by a wall in imperfect repair; its most notable buildings are two fine mosques and the tomb of Zobeir. It is a military station, with a dockyard and a factory, and is the seat of a British consul and of a United States consular agent. The consulates and mercantile establishments line the river bank in the Margil suburb. The climate is malarious and unhealthful, and the water supply bad. The population of Basra, which in the eighteenth century was estimated at 151,000, is now about 55,000, and consists chiefly of Arabs, a few Europeans and Indians, and some 3000 Persian merchants and employees, 2000 Jews, and 400 Armenians.

BAS-RELIEF, *bā-ré-léf'* (Fr. low relief). See RELIEF SCULPTURE.

BASS, *bās*, or **BASE** (Fr. *bas*, fem. *basse*, It. *basso*, low, from LL. *bassus*, low, short). The deepest or lowest part in a musical composition and the deepest or lowest tone in a chord. It is next to the upper part in the independence and originality of the melodic design, and in respect to harmony it is the most important part, containing more frequently the fundamental notes of the chords; on it, moreover, is formed the effective musical figure known as organ point (q.v.). *Bass* or *basso*.—The lowest male voice, generally with a compass of F to d', all in the chest register (q.v.). Some exceptional voices have even a larger range, going down to C or B₁; these are called *basso profundo*. For origin of word, see ALTO. *Bass*.—The name of an old bow instrument with five or six strings, intermediate between the cello and double bass. In older scores the word "basses" or *bassi* refers to both cellos and contrabasses, for which only one part was written. In modern scores, where cellos and double basses generally have different parts, the word "basses" denotes double basses only. (See DOUBLE BASS.) *Basso ostinato*, or ground bass, is a figure of one, two, or four measures constantly repeated. *Basso continuo* means thorough or figured bass (q.v.). For bass clef, see MUSICAL NOTATION.

BASS, *bās* (originally *barse*, AS. *baers*, the perch). The name of many fishes, chiefly and most correctly applied to those of the perciform families Serranidae and Centrarchidae. The former family include the *Salt-water Bass*, represented typically in Europe by the sea perch (*Morone labrax*, formerly called *Labrax lupus*), to which the old English name "basse" was first applied. This is common in the Mediterranean and in British and Dutch waters, swimming in shoals and entering estuaries and streams to spawn. It may reach 2½ feet in length and is highly esteemed as food. The nearly related American striped bass, or rockfish, *Morone tinea* (see Colored Plate accompanying TROUT), often reaches a weight of 30 to 90 pounds, is distributed along the entire east coast of the

United States, ascending at times 30 to 50 miles above the tide-water line, is very abundant, and enters rivers in the spring to spawn. It is one of the most important American food-fishes, and has been introduced by the United States Fish Commission to the Pacific coast, where it has now become numerous and valuable. Angling for this fish is one of the foremost sports along the eastern coast as far north as the Bay of Fundy, where they congregate in great numbers. Various methods are employed, as trolling, in Chesapeake Bay, etc.; but the customary method is to cast in the surf with a rod and reel, the former like a salmon rod, and the reel capable of holding 200 to 300 yards of line. The season is July, August, and September, when the fish approach close to the shore, schooling in the surf and entering bays and rivers. Hence such rocky shores as those from New York City to Cape Cod are favorable; and the finest of sport is enjoyed from out-reaching rocks at the entrance of Buzzard's and Narragansett bays, where expensive stagings are often erected for convenience. Living bait of great variety is used, and very long and skillful casting is required, success being rewarded by an exciting tussle with this strong and spirited fish, calling for the highest skill. In the upper waters of the tidal rivers, when found resting below the rapids, it will take a gaudy fly very greedily and give fine sport.

The yellow bass (*Morone interrupta*) of the lower Mississippi valley, the white perch (*Morone americana*) of the Atlantic coast (but also sometimes landlocked), and the white bass, or white perch (*Morone* or *Roccus chrysops*), of the Great Lakes and Mississippi valley, are all excellent food fishes and are true bass. Other marine fishes are sometimes styled bass, as the weak-fish and various relatives, which are "sea bass," one (*Cynoscion nobilis*) being the "white sea bass" of the Californian markets. In the Southern States the drum (*Pogonias*) is so known.

The *Fresh-water Bass* belong to the sunfish family, Centrarchidae, and are prominently represented by the two black bass of sportsmen—the small-mouthed (*Micropterus dolomieu*) and the large-mouthed (*Micropterus salmoides*). In waters east of the Alleghenies they are imported fish, getting into the Hudson through the Erie Canal as early as 1825. They were first planted in the waters of eastern New York and the other Middle States nearly 50 years ago, a small quantity having been brought in 1853 from the Youghiogheny River and planted in the Baltimore and Ohio Canal, whence they found their way into the Potomac, Susquehanna, Delaware, and other rivers. The small-mouthed bass prefers clear, running streams, but the large-mouthed prefers quiet waters. The latter grows to a larger size, an extreme weight being 20 pounds, a not uncommon weight 6 to 10 pounds. Both are variable in color and highly esteemed for food, and both are among the best, if not the very best, game fish of the United States.

Special tackle has been developed for bass fishing, the fly rod being as light and comely as that for trout, though somewhat heavier tackle must be used on lakes than along streams, where a 7½-ounce rod 10 feet long suffices, with a fine line, very strong leaders, and hooks less than No. 2. The flies used are

1. WHITE BASS (*Roccus chrysops*).
2. YELLOW BASS (*Morone interrupta*).
3. BIG-MOUTHED BLACK BASS (*Micropterus salmoides*).

4. CALICO BASS (*Pomoxis sparoides*).
5. SMALL-MOUTHED BLACK BASS (*Micropterus dolomieu*).
6. ROCK BASS (*Ambloplites rupestris*).

larger than those for trout, brown, red, and black "hackles" being recommended for general use. A shorter and, by a trifle, heavier rod is used for minnow casting. The time for bass fishing in the Gulf States is in autumn and winter; in the Northern and Central States in May and June or in September and October.

Other species in this family are the rock bass or redeye (*Ambloplites rupestris*) and the calico or grass bass (*Pomoxis sparoides*), both good food fishes and much used in the Mississippi valley. Consult the bibliographies under ANGLING. See Plate of FRESH-WATER BASS and Colored Plate of TROUT; FISHERIES.

BASS, *bās*, EDWARD (1726-1803). The first Protestant Episcopal Bishop of Massachusetts, his native State. He graduated at Harvard in 1744, was ordained in England by Bishop Sherlock in 1752, and on his return became and remained through life rector of St. Paul's at Newburyport. In 1797 he was consecrated first Bishop of Massachusetts, his jurisdiction being afterward extended over New Hampshire and Rhode Island. Consult D. D. Addison, *Life and Times of Edward Bass* (Boston, 1897).

BASS, ROBERT PERKINS (1873-). An American public official, born in Chicago. After graduating from Harvard in 1896, he studied for two years in the graduate and law schools of that university. He became interested in farming and in real estate, and devoted particular attention to the advancement of forestry in New Hampshire. Preceding his election in 1911 as Governor of New Hampshire, he had been for two years a member of the State Senate, and for four years before that a member of the State House of Representatives. During all this period he had been one of the leaders in opposition to the Republican "machine" in New Hampshire, and when he came to be chosen to the highest office in the State, it was on a platform that pledged him to carry out important legislative reforms. In a measure his efforts were successful. (See NEW HAMPSHIRE, *History*.) In 1912, however, he was not a candidate for reelection on the Republican ticket, but left that party to head the Progressive movement in the State. Before the formation of a separate Progressive party he was one of the seven Governors who signed a petition to Theodore Roosevelt, asking the latter to become a candidate for the presidential nomination at the Republican Convention.

BASSANIO, *bās-sā'nē-ō*. Portia's lover in Shakespeare's *Merchant of Venice* (q.v.). He chose the leaden casket and won her for his wife.

BASSANO, *bās-sā'nō* (anciently *Bassanum*). A city in the province of Vicenza, north Italy, on the Brenta River, and the Padua-Bassano Railway, 30 miles north of Padua (Map: Italy, F 2). It has a castle and high walls and is picturesquely situated at the foot of the Alps. In the cathedral and the other churches and in the museum are paintings by J. Bassano; Canova's "Death of Socrates" is in the Villa Rezzonica. Bassano manufactures leather and majolica, has a great printing establishment, and there is an active commerce in silk, leather, oil, wine, and asparagus. In 1796 Bonaparte defeated the Austrians here. Pop., 1901 (commune), 15,443; 1911, 17,130.

BASSANO. A family of Italian painters, so called from their residence, a town near Vicenza; their real name was Da Ponte. FRANCESCO, founder of the family, was probably a

pupil of Bartolommeo Montagna at Vicenza. The most prominent member of the family was his son and pupil JACOPO (Giacomo) DA PONTE (1510-92), who was, however, more influenced by his study of the works of Bonifazio and Titian at Venice. Practically all his life was spent in his native town, where he acquired much wealth, was accorded freedom from taxation, and even chosen chief magistrate (consul). After his return from Venice to Bassano he formed an individual style, suggested by his rustic environment, and became the founder of genre painting, properly so called, in Italy and Europe. His earliest works are of a conventional religious character, but by far the greater number of his latest and best productions are scenes from peasant life, often in beautiful landscapes. Under the guise of some scriptural title the sacred personages appear in these scenes as peasants. Assisted in patriarchal fashion by his four sons, he conducted an atelier the output of which was enormous. It is almost impossible to distinguish the authorship of most of these paintings; only the very best examples may be safely attributed to him. He also painted a few portraits. The most striking technical features of his painting are the bold play of light and the gem-like effect of his coloring. Two of his best works from scriptural subjects are in his native town; the museums of Vienna, Dresden, and Paris are particularly rich. A fine example, "Lazarus and Dives," belonging to Mr. Dan Fellows Platt of Englewood, N. J., was shown in the Metropolitan Museum of Art, New York City (1913). The painter had four sons, of whom the most noted were FRANCESCO (1545-97) and LEONARDO (1558-1623). Francesco's best-known work is a painting on the ceiling of the Ducal Palace, Venice, "The Capture of Pavia by Night." Consult Berenson, *Venetian Painters* (New York, 1894).

BAS'SARIS, or **BASARISK**. The Caco-mistle (q.v.).

BASS (*bās*) **DRUM**. See **DRUM**.

BASEDAU, JOHANN BERNHARD. See **BASEDOW**.

BASSEIN, *bās-sān'* (Hind. *Wassim*). A town in the presidency of Bombay, India, situated on an island of the same name, 28 miles north of the city of Bombay; lat. of island, 19° 20' to 19° 28' N. In 1720 the town had over 60,000 inhabitants, but through war, plague, and other causes has decayed until its population had dwindled to 9598 in 1911. It still exports considerable quantities of rice. In 1534 it was ceded to the Portuguese; in 1765, after a possession of 231 years, it was wrested from them by the Mahrattas; in 1780 it surrendered to the British after a siege of 12 days. The island contains about 35 square miles; it is separated from the continent by a narrow channel, which, as a shelter for shipping, constituted its value in the eyes of the Portuguese. Bassein is of historical interest, having been promised, though never delivered, as part of the dowry of Charles II's Portuguese consort.

BASSEIN, or **BASSIM**. The capital of the district of Bassein in lower Burma, on the left bank of a mouth of the Irrawaddy, 90 miles from the sea (Map: Burma, B 3). Its inland water connection and the opening of a railway in 1903 have enhanced its importance as a centre of commerce. The principal trade is in rice. The United States is represented by a consular

agent. The place is of military importance also, as it commands the navigation of the river. It was captured by the British in 1852. Pop., of town, 1901, 31,864; 1911, 37,081; area of district, 4127 square miles; pop., 1891, 311,260; 1901, 383,100; 1911, 440,988.

BASSELIN, bäs'län', or **BACHELIN**, OLIVIER (c.1350-c.1419). A French poet, born in the Val-de-Vire, Normandy. Songs on convivial themes, ascribed to him, but now attributed to Jean le Houx (*Livre des chansons nouveaux et l'aux-de-Vire*, 1610 and 1858), are usually regarded as the origin of modern vaudeville. The song "To my Nose," celebrating its ruddy efflorescence, is the best known. Consult Gasté, *Etude sur Olivier Basselin et les compagnons du Vau de Vire* (Caen, 1866), and Gasté, *Olivier Basselin et le Vau de Vire* (Paris, 1887).

BASSES-ALPES, bäs'alp'. A southeastern department of France, bordering on Italy (Map: France, S., L 4). It has an area of 2697 square miles; is mountainous, is watered by the Durance, and has much pasture land. The climate is severe, but the natural beauties attract visitors. The valleys are fertile, and much fruit is grown. Meagre transportation facilities hinder the development of manufacture and commerce. Pop., 1896, 116,028; 1906, 113,126; 1911, 107,231. Capital, Digne.

BASSES-PYRÉNÉES, bäs'pé'rä'nä'. A southwestern department of France, bordering on Spain and the Bay of Biscay (Map: France, S., D 5). Area, 2978 square miles. The chief rivers are the Nive and the Odour. The southern part is wholly mountainous; the remainder is composed of wild heath land and fertile valleys. Agriculture, pasturing, lumbering, quarrying, and the manufacture of woolen goods, leather, paper, etc., are the leading industries. There is considerable domestic commerce, and export trade in minerals, lumber, wine, etc. A large part of this passes through Bayonne, the chief port. Pop., 1896, 421,955; 1906, 425,817; 1911, 433,318. Capital, Pau.

BAS/SET, or **BAS/SET HOUND**. See **BADGER DOG**; **HOUND**.

BASSET, RENÉ (1855-). A French Orientalist, born at Lunéville. He studied in Paris at the School of Oriental Languages and in 1880 became professor of Arabic at the Ecole supérieure des Lettres in Algiers. Much of his work covers a study of the languages, history, archaeology, geography, and folklore of the tribes living in the French possessions of Algeria and northwest Africa. His publications include: *Prière des mussulmans chinois, traduite sur l'original imprimé à Canton* (1878); *La poésie arabe antéislamique* (1880); *Etudes sur l'histoire d'Ethiopie* (1882); *Contes populaires berbères* (1887); *Nouveaux contes berbères* (1897); *Rapport sur les études berbères et haoussa* (1902); *Contes populaires d'Afrique* (1903). He also translated *Les Apocryphes éthiopiens* (1893-99) and was editor of the *Encyclopédie des Islam*.

BASSETTERRE, bäs'tär (Fr. lowland). The capital of the British West Indian island of St. Christopher, or St. Kitts, situated on the southwestern coast (Map: West Indies, G 3). It is well built and possesses several churches, a botanical garden, and a library. There are manufactories of sugar, and this commodity is the leading article of trade. Pop., 1901, 9962; 1911, 8200.

BASSE-TERRE. The capital and political

centre of the French West Indian island of Guadeloupe, situated on the southwest coast, at the mouth of the Rivière-aux-Herbes (Map: West Indies, G 4). Its commercial importance is small because of an open harbor. Basse-Terre is the seat of a bishop, is well built, its streets are lighted by electricity, and it contains a number of fine public buildings. Pop., 1903, 7464.

BAS/SETT, JAMES (1834-1906). An American missionary, born near Hamilton, Ontario. He graduated in 1856 at Wabash College and in 1859 at Lane Theological Seminary, served as chaplain in 1862-63 in the Federal army, and from 1863 to 1871 held various pastorates. In 1871 he became a missionary for the Presbyterian Board and traveled widely throughout Europe, spending many years in Turkey and Persia, in which latter country he was a pioneer missionary worker. He is believed to have been the first American to penetrate as far east as the tomb of Harun al-Rashid at Meshed, eastern Khorasan. He founded the mission in eastern and central Persia, and did much to effect the appointment of a United States legation to Persia. His publications include: *Hymns in Persian* (1873); *Among the Turcomans* (1880); a translation into Gaghatti Tatar of the *Gospel According to Matthew*; *A Grammatical Note on the Simnuni Dialects of the Persian* (1884); *Persia, the Land of the Imāms* (1886).

BASSETT, JOHN SPENCER (1867-). An American historian, born at Tarboro, N. C. He graduated at Trinity College, N. C., in 1888, was appointed professor of history there (1893), and in 1906 became professor of history at Smith College. His publications deal with the history of North Carolina, and include: "The Constitutional Beginnings of North Carolina 1663-1729" (1894); "Slavery and Servitude in the Colony of North Carolina" (1896); "Slavery in the State of North Carolina" (1899); "The Federalist System" (1905)—all included in the *Johns Hopkins University Studies in History and Political Science*; *A Life of Andrew Jackson* (1911); *A Short History of the United States* (1913).

BASSI, bäs'sé, PADRE UGO (1800-49). An Italian priest and patriot, active in the revolutionary movement. He stirred up the people for the defense of Rome against the French and during the siege displayed great personal heroism. He was taken prisoner by the French (April 30, 1849), but soon released. When resistance proved hopeless, he accompanied Garibaldi, whose chaplain he had become, to Casena. Their ships were scattered, and Bassi fell into the hands of the Austrians, by whom he was taken to Bologna and after cruel tortures was shot. His last words were "God save Italy." Consult Zironi, *Vita del Padre Ugo Bassi* (Bologna, 1879), and F. Venosta, "Ugo Bassi, Martire di Bologna" in the *Pantheon dei Martiri Italiani* (Milan, 1863).

BASSIM. See **BASSEIN**.

BASSO, bäs'só. See **BASS**.

BASSOMPIERRE, bäs-on'pyär', FRANÇOIS DE (1579-1646). A marshal of France. He was born at Harouel, in Lorraine, and at an early age gained the favor of Henry IV, whom he resembled greatly in character. He fought in Savoy (1602), in Hungary (1603), at La Rochelle (1628), at the Pass of Susa (1629), and in Languedoc (1631). He was also sent on

diplomatic missions to Spain, to England, and to Switzerland. Made marshal in 1622, he awakened the suspicion and resentment of Richelieu, who, in 1631 caused him to be cast into the Bastille, from which he was not liberated until the death of Richelieu, in 1643. His *Memoirs* (Cologne, 1665), written in the Bastille, though unreliable in detail, provide a good reproduction of the society in which he lived.

BASSOON' (Fr. *basson*, It. *bassone*, from *basso*, low, called in Italian *fagotto*, bundle). A musical instrument of the double-reed variety, the bass of the wood-wind family of instruments. In 1539 Afranio, a canon of Ferrara, conceived the idea of bending double the long *bombardo* then in use, so as to make it easier for handling, hence the Italian name. It is made of maple wood or plane tree, with a long S-shaped metal mouthpiece, and is provided generally with 8 holes and 10 keys. Its enormous compass of 3 octaves, B₁ to c², contains 3 registers: the lower powerful, solemn, and majestic; the middle sweetly expressive, but weak; and the upper register sorrowful. In addition, it possesses certain tones that are comic to grotesqueness, as in the famous "honor" monologue in Verdi's *Falstaff*. These combined qualities make the bassoon one of the most serviceable and frequently employed of the wind instruments in an orchestra. The notes for the bassoon are written on the bass clef for the lower register and on the tenor clef for the higher. There are several sizes of bassoons, the most important among them the tenor bassoon, a fifth higher (now almost obsolete), and the double bassoon, an octave lower, than the ordinary bassoon. Bassoon is also the name of an organ stop the pipes of which are made to imitate the tones of the instrument. Consult Teuchert and Haupt, *Musikinstrumente in Wort und Bild* (Leipzig, 1911).

BASSORA, bäs'so-rà. See BASRA.

BASSO-RILIEVO, bäs'só rê-lyá'vó. See RELIEF SCULPTURE.

BASS ROCK. A rocky islet in the Firth of Forth, 1½ miles off the coast of Haddingtonshire, Scotland (Map: Scotland, F 3). It rises precipitously 320 feet above the sea and is about 1 mile in circumference. Of volcanic origin, and geologically interesting, its chief importance arises from its historical associations. As a fortress and state prison, the principal event in its history was the siege sustained by 24 of James II's supporters against the forces of William III during 1691-94, which ended in an honorable capitulation. It is the resort of innumerable flocks of sea fowl, especially solan geese, which form a profitable source of revenue. A lighthouse with a six-flash lantern of 39,000 candle power was established on the rock in 1902.

BASS STRAIT. The channel separating Tasmania from Australia (Map: Tasmania, C 1). It is about 185 miles long and from 80 to 150 miles broad and contains many small islands. The name of the strait is derived from that of Dr. George Bass, who first proved that Tasmania was an island by circumnavigating it in 1798.

BASS (bäs) **TU'BA**. See TUBA.

BASS'WOOD. See LIME TREE.

BAST (origin obscure). An old term formerly applied to the fibrous tissue of the inner bark (q.v.), but now used as synonymous with "phloem" (q.v.). The vascular bundles of

plants always include two regions, the "xylem" (wood) and the "phloem" (bast). In ordinary stems the vascular bundles form a cylinder, the xylem being the inner region of the cylinder and the phloem the outer region. The characteristic vessels of the xylem are the "tracheæ," through which the water ("sap") moves as it ascends the stem. The characteristic vessels of the phloem are the "sieve vessels," in which various foods of the plant are stored temporarily, being available for use at any time.

In stems that increase in diameter a "cambium" is formed between the xylem and phloem, a tissue which has the power of adding new tissue to the xylem and to the phloem. The new xylem is laid down in concentric rings ("annual rings"), thus increasing the diameter of the xylem cylinder. The new phloem is also laid down in concentric rings, but the older outer rings are pressed against the cortex by the increasing xylem, so that the older phloem becomes more or less disorganized. When the bark of such a stem is removed, it is peeled off down to the cambium, so that the innermost part of the bark consists of the removed phloem. It was to this phloem constituent of the bark that the term "bast" was originally applied, but, since it has become synonymous with "phloem," it applies wherever vascular bundles occur, as in stems without bark, veins of leaves, etc.

The principal bast fibres in commercial use are those derived from the flax, hemp, jute, ramie, or China grass, sunn hemp, and Cuba bast, or related species of *Hibiscus*. See FIBRE and the names just mentioned.

BAST. See BARK.

BASTABLE, CHARLES FRANCIS (1855-). An Irish political economist, born at Charleville, Cork. He studied at Trinity College, Dublin, and in 1882 was appointed professor of political economy in Dublin University. In 1888-93, and 1897 he was an examiner for the University of London, and became in 1902 professor of jurisprudence and international law and in 1908 regius professor of law at Dublin. He wrote *The Commerce of Nations* (1892; 5th ed., 1911), *Public Finance* (1895), *The Theory of International Trade* (1897; 3d ed., 1903).

BASTARD (OF. *bastard*, Fr. *bâtard*, probably from LL. *bastum*, OF. *bast*, Fr. *bât*, pack saddle; equivalent to OF. *fls-de-bast*, son of a pack saddle, bastard, referring to the use of pack saddles as beds in taverns, by muleteers). An illegitimate child, one neither begotten nor born in lawful wedlock; specifically, one born of a spinster, of a widow whose husband has been dead such a length of time as to make it impossible for him to be the father, or of a married woman when proof positive is produced that the paternity is other than of the husband. Where the mother is married, the presumption of the law is exceedingly strong in favor of the legitimacy of the offspring. The old English law went so far as to make the presumption conclusive in case the husband was, at the presumed time of conception, "within the four seas" surrounding Great Britain. But illegitimacy may now be proved in England as well as in this country, by evidence establishing the fact beyond a reasonable doubt. Under the Roman or civil law, a child born before the marriage of its parents was legitimated by their subsequent marriage. This principle is followed in the law of those countries which were

grounded in the Roman rather than the English common law; viz., Scotland and the nations of the continent of Europe; and in Louisiana, the province of Quebec, and the states of Central and South America. In most of the United States the civil-law rule has been adopted by statute. The common law recognized no such principle, and it was expressly repudiated in the famous Statute of Merton, enacted by Parliament in 1235 (20 Hen. iii, chap. 9). The bishops having "instanted the lords that they would consent that all such as were born afore matrimony should be legitimate, as well as they that be born within matrimony; as to the succession of inheritance, forasmuch as the Church accepteth such for legitimate, . . . all the earls and barons with one voice answered that they would not change the laws of the realm which hitherto have been used and approved." This continues to be the English law, the only exception to it being the case of a *bastard eigné* (Old Law French), where a son born before marriage succeeded without opposition to the father's estate, although the latter had a legitimate heir; if the possession of the so-called *bastard eigné* was undisputed during his lifetime, and his legal heir claimed the estate, it was no bar to that claim to prove the bastardy of the father.

An illegitimate child is, in the old law phrase, *filius nullius*, the son of no one. His parents are not under any parental obligation to him, and it is only in the interests of the parish and at the instance of the authorities thereof that they can be compelled to support him. He has, at least under the common law, no legal name until by reputation he acquires one, and he has no right of inheritance as an heir. Furthermore his own heirs at law can be only those of direct descent from him. If he die intestate, leaving no children or grandchildren, his property will not by law become that of his father or mother, brother or sister, or uncle or aunt, but will escheat to the state, and in the United States may be claimed by the public administrator. But several of the States have by statute allowed an illegitimate child to inherit from his mother and in some cases his mother to inherit from him as heir or next of kin. The maintenance of an illegitimate child devolves by common law in the first instance upon his mother; but in order that the child may not be a burden on the public, statutes in England and similar enactments in all of the States in this country allow proceedings to be taken to compel the father to aid in supporting the child. This procedure is based, not on the theory that the child has a right to his support, but solely to prevent the burden of support from falling upon the parish or county. The usual practice in such a proceeding is for the alleged paternity to be established by direct evidence (the testimony of the mother being admitted as of strong, though not conclusive, weight), after which the putative father is called on to give bond to the magistrate or overseers of the poor to contribute a fixed sum for an agreed time to the support of the child. (See AFFILIATION.) The custody of the child belongs primarily to the mother, but the court may determine the time during which such custody may last. In all civil and criminal rights not connected with the law of inheritance, or of support from parents, the status of the bastard is the same as that of any other person. He may hold and dispose of

real and personal property, may sue and be sued, may devise by will, and may claim the protection of the state in all respects as though he were legitimate. In questions of settlement arising under poor laws, it has been held that his legal domicile is that of the mother, not, as with legitimate children, of the father, until he attains a settlement of his own. It has also been held that the ordinary right of a father to appoint by will or deed a guardian for his minor child does not exist in the case of a bastard.

The term has not always been one of contempt and humiliation. William the Conqueror was not ashamed to sign himself "Guillaume Bastard"; and the title has been borne without reproach by many other characters famous in history, as Don John of Austria, and Dunois, "the Bastard of Orleans." Consult the *Commentaries* of Kent and Blackstone; also, Schouler, *Treatise on the Law of the Domestic Relations* (5th ed., Boston, 1895); Nicholls, *History of the English Poor Law*, vol. i (London, 1854). See ILLEGITIMACY; POOR LAWS.

BASTARD BAR, or **BAR SIN'ISTER**. See HERALDRY.

BASTARD OF ORLEANS. See JEAN DUNOIS.

BASTARD SAFFRON. See SAFFLOWER.

BASTIA, *bàs-tè'a* (It. fortress, bastion). The chief commercial town of the insular department of Corsica (Corse), France, on the east coast, opposite the Isle of Elba, 98 miles northeast of Ajaccio by rail (Map: France, S., M 6). Its streets are narrow and crooked, but its buildings are comparatively modern; it has two harbors, the new and the old, and a fine marine parade, adorned with a marble statue of Napoleon by Bartolini. The citadel and the cathedral of San Giovanni Batista are noteworthy. Its public institutions are a lyceum, a library with over 30,000 volumes, and fine collections of natural history. Wax candles, liqueurs, macaroni, tobacco, and soap are manufactured, and marble quarries, tanyards, and dye works give employment to many operatives. Bastia is an important trade centre and exports fruit, vegetables, minerals, and fish. The town is the seat of a United States consular agent. Bastia was built by the Genoese in 1380 and derives its name from the strong fortress or bastion which they built to protect it. After its cession to France in 1769 it became the capital, but in 1811 Ajaccio was selected in its place. Pop., 1901, 25,425; 1906, 27,338; 1911, 29,412.

BASTIAN, *bàs'tè-an*, ADOLF (1826-1905). A German traveler and anthropologist. He was born at Bremen, June 26, 1826, and was educated as a physician, studying at Berlin, Heidelberg, Prague, Jena, and Würzburg. His authority as an anthropologist rests upon an immense storehouse of facts, gathered during a series of extensive journeys in Asia, Africa, Australia, and America. In 1866 Bastian became docent at the University of Berlin and subsequently was made professor of ethnology. In 1869, with Virchow and R. Hartmann, he became editor of the *Zeitschrift für Ethnologie*, the organ of the Berlin Anthropological and Ethnological Society, of which he was one of the founders. He became in 1886 director of the new Museum für Völkerkunde. In 1901 he was editor of the *Ethnographisches Notizblatt*, published in Berlin. Bastian was a prolific writer, since 1859 having published nearly 60 works, comprising more than 80 volumes, dealing with various

subjects in anthropology. Within that province his range is extremely wide, his works embracing both ethnographic studies in the narrow sense as well as philosophic investigations in race and human psychology. A partial list of his works may serve to indicate the broad sweep of his acquisitions in anthropology: *Der Mensch in der Geschichte* (3 vols., 1860); *Die Völker der östlichen Asien* (1866-71); *Das Beständige in den Menschenrassen* (1868); *Beiträge zur vergleichenden Psychologie* (1868); *Ethnographische Forschungen* (2 vols., 1871-73); *Schöpfung oder Entstehung* (1875); *Die Vorgeschichte der Ethnologie* (1881); *Der Buddhismus in seiner Psychologie* (1882); *Amerikas Nordwestküste* (1883); *Inselgruppen in Ozeanien* (1883); *Indonesien* (1884-94); *Der Fetisch an der Küste Guineas* (1884); *Die Seele indischer und hellenistischer Philosophie* (1886); *Ueber Klima und Acclimatisation* (1889); *Ideale Welten* (1893); *Vorgeschichtliche Schöpfungsgedanken* (1893); *Ethnische Elementargedanken* (1895); *Die mikronesischen Kolonien* (1899-1900); *Die Völkerkunde und der Völkerverkehr* (1900).

BASTIAN, bäs'tyan, HENRY CHARLTON (1837-). An eminent English physiologist. He was admitted to the Royal College of Surgeons in 1860, was assistant curator in the Museum of the University College in London from 1860 to 1863; professor of pathological anatomy in the same college from 1867 to 1887; professor of principles and practice of medicine from 1887 to 1897; and physician to the University College Hospital from 1867 to 1897. In 1898 he was elected emeritus professor of the principles and practice of medicine at University College, London. He is recognized as an authority in the pathology of the nervous system and was one of the ablest defenders of the theory of spontaneous generation. He published: *The Modes of Origin of Lowest Organisms* (1871); *The Beginnings of Life* (1872); *The Brain as an Organ of the Mind* (1880); *Paralysis: Cerebral, Bulbar, and Spinal* (1886); *Various Forms of Hysterical or Functional Paralysis* (1893); *A Treatise on Aphasia and Other Speech Defects* (1898); *The Nature and Origin of Living Matter* (1905); *Evolution of Life* (1907); *Origin of Life* (1911).

BASTIAT, bäs'tyā', FRÉDÉRIC (1801-50). An eminent French political economist. He was born at Bayonne, June 20, 1801. His father was a merchant and educated his son with a view to the same pursuit. His first appearance as an author was in 1844, when he published, in the *Journal des Economistes*, an article entitled "De l'influence des tarifs français et anglais sur l'avenir des deux peuples." It contained in germ the theory of political economy subsequently developed by Bastiat, who from that moment was known as a decided opponent of the system of protection. Subsequently, in the same journal, he combated the economic fallacies of Socialism. During a visit to England he made the acquaintance of Cobden, and on his return to France he translated (1845) the speeches of the Free-Trade advocates, which he published in Paris with an introduction, entitled *Cobden et la liqur; ou l'agitation anglaise pour la liberté des échanges*, in which he presented a complete summary of the arguments against the protective system. Bastiat continued to propagate his views with considerable success. He became secretary of the societies and chief editor of the

journal established to vindicate the principles of Free Trade. After the Revolution of 1848 he was elected successively a member of the Constituent and Legislative assemblies. In 1850 he came forward as the antagonist of the Socialist writer, Proudhon. Suffering from pulmonary disease, he repaired to Italy for change of climate, but died at Rome on Dec. 24, 1850. Besides the writings mentioned, Bastiat published *Sophismes économiques; Propriété et loi; Justice et fraternité; Protectionisme et communisme; Harmonies économiques*; and several other important treatises, all of which exhibit extensive knowledge of the subjects discussed, convincing logic, and a power of sprightly and biting satire. The *Harmonies économiques* and the *Sophismes* have been translated by J. P. Stirling. The fundamental thesis of Bastiat's system of economics is that unrestricted competition necessarily produces a universal harmony of interests. While the writings of Bastiat have had great influence, his main thesis has not found general acceptance. A new edition of his works in seven volumes was published at Paris in 1881. Consult Bondurand, *Frédéric Bastiat* (Paris, 1879), and Von Leesen, *Frédéric Bastiat* (Munich, 1904).

BASTIDE, bäs'téd', JULES (1800-79). A French publicist and politician, born in Paris. In 1821 he became one of the first members of the French Carbonari, and after the July Revolution he was conspicuous among the writers of the radical opposition. On the reconstruction of the National Guard he was elected commandant in chief of the legion of artillery and took part in the two insurrectionary movements, for the second of which—the *émeute* in Paris, June 5, 1832—he was condemned to death, but escaped to London. Pardoned in 1834, he returned to Paris and again devoted himself to politics, contributing articles to a daily journal, the *National*, of which he became editor in 1836. In 1847 he founded the *Revue Nationale*. He was one of the principal agitators in the Revolution of 1848 and became Minister of Foreign Affairs. After the coup d'état he withdrew from political life. He published: *De l'éducation publique en France* (1847); *La république française et l'Italie en 1848* (1858); *Histoire des guerres religieuses en France* (1859).

BASTIEN-LEPAGE, bäs'tyän' le-pázh', JULES (1848-84). A French painter. He was born of peasant stock at Damvillers, a village of Lorraine, Nov. 1, 1848. His early bent towards art was wisely fostered by his father. After graduating from the College of Verdun, he went to study in Paris in 1867. Here he was at first a student by day, and at night a postal agent, and then entered the class of Cabanel at the Ecole des Beaux-Arts. He was little influenced by this training, but more by the works of Manet (q.v.). The first of his pictures to command attention were in the Salon in 1874, where he exhibited "The Song of Spring" and a "Portrait of My Grandfather," which struck a new note in portraiture. It was painted *en plein air* and full of delicate outdoor light, very truly recorded. The attitude of the figure was unconventional; the model was in the act of snuff taking. This was the first of a series of triumphs, which brought him several medals, election to the Legion of Honor, and recognition in other countries; but he always remained a loyal son of his native village, where he painted the peasant scenes, which are his most ambitious

productions. Constantly in delicate health, he died of cancer of the stomach at Paris, Dec. 10, 1884, and was interred in the church of his native village. His last years were brightened by the friendship of his pupil Marie Bashkirtseff (q.v.), whose death preceded his by only one month. His chief canvases are "The Haymakers" (1878), in the Luxembourg (Paris); "The Potato Gatherers" (1879); "Joan of Arc Listening to the Voices" (1880), Metropolitan Museum of Art, New York. Mention should also be made of "The Beggar" (1881), "Love in a Village" (1883), and his last dated work, "The Forge" (1884). His numerous portraits are remarkable for strong characterization, attained through the closeness of their drawing. Among his notable subjects are Mme. Sarah Bernhardt, Albert Wolff, the Prince of Wales (Edward VII), and Gambetta on his deathbed. Bastien-Lepage was a thoroughgoing realist, whose art represents the application of the *plein air* methods of the Impressionists to figure and bust subjects. His color resembles theirs in its high scale, but he pays more attention to detail and lacks their facility. His pictures vary much in quality. Consult: Marie Bashkirtseff, *Journal intime* (Paris, 1890); the biographies by Theuriet (Paris, 1885), and De Fourcaud (ib., 1888); Arnic, *J. Bastien-Lepage, lettres et souvenirs* (Evreux, 1896).

BASTILLE, bas-têl' (Fr. fortress, from OF. *bastir*, to build). A name originally applied in France to any building constructed of masonry, with towers or bastions adapted for defense. These fortresses were once very numerous, especially at Paris; but Cardinal Mazarin, as a part of his anti-feudal policy, allowed only a few of them to remain standing, among these being the Castle of Paris, to which the name Bastille was at last exclusively applied. This castle developed from two towers on either side of the road which entered Paris by the Faubourg Saint-Antoine. By the orders of Charles V Hugues Aubriot converted the towers into a castle of four bastions, connected by thick walls, the whole being surrounded by a moat 25 feet deep. The number of bastions was subsequently doubled, and the area of the whole correspondingly increased. The Bastille, from its commanding position, was closely connected with important affairs in French history and was occupied by the Guises in 1588, by Henry IV in 1594, the Frondeurs in 1649, and Condé in 1652. During its entire history it was utilized as a state prison, there being cells and dungeons for as many as 80 prisoners—a limit often reached. There was undoubtedly considerable severity exercised at different times, but whether the treatment there was any more strict than the customary prison discipline of the age, it is hard to determine. It seems established that many of the noble prisoners, at least, were treated with considerable lenity; but accounts of cruelty, some of which were probably well founded and others exaggerated, and the association of the Bastille with the use of the *lettres-de-cachet* (q.v.), which kept so many in confinement without trial, caused this prison to be regarded as the symbol of oppression. It was natural, therefore, that the Bastille should be one of the first objects of attack at the outbreak of the Revolution. On July 14, 1789, the populace of Paris, recruited chiefly from the Faubourg Saint-Antoine, attacked the fortress and stormed it after a half-hearted resistance by

the Governor, De Launay, and a handful of Swiss. The Governor and seven of his men were killed, the archives of the prison scattered, and the prisoners, seven in number, were carried through the streets and hailed as victims of tyranny and martyrs in the people's cause. The building itself was torn down, and the key sent by Thomas Paine as a present to George Washington. The anniversary of the taking of the Bastille is celebrated every year as the national holiday of France. Its site is marked by a bronze column.

Consult: Arnold, *Histoire de la Bastille* (Paris, 1845-59); Bingham, *The Bastille* (London, 1888); Davenport, *History of the Bastille* (London, 1837); Funck-Brentano, *The Bastille*, (Eng. trans., New York, 1900). The documentary records which escaped destruction are contained and explained in Ravaissou, *Les archives de la Bastille* (6 vols., Paris, 1866-73).

BAS'TINA'DO (Sp. *bastonada*, Fr. *bastonnade*, from OF. *baston*, Fr. *bâton*, cudgel). The name given by Europeans to the punishment in use in the Orient, which consists in blows inflicted with a stick, generally upon the soles of the feet, but sometimes also upon the back.

BAS'TION. A tower or projecting portion of the walls of a fortification, and the most important part of the fortifications of the *enceinte* (q.v.). The rampart forming a bastion is constructed as if on four sides of a pentagon, two of which (called the *faces*) form an angle with the point toward the exterior; the other two sides (the *flanks*) connect the extremities of the faces with the adjacent curtains. The fifth (supposed) side of the bastion is left open, the intervening space being known as the *gorge*. The bastion system dates back to the first rude means used in fortification, which probably consisted of nothing more than simple inclosures, surrounded with palisades; a device still employed by the natives of semi-civilized states. High walls with breastwork or parapets undoubtedly followed, to enable the defenders to examine the surrounding country. The bastion as it is known to-day, however, is of Italian origin, the most ancient at present existing bearing the date of 1527 and being situated at Verona. Bastions are generally designated by numbers, as are also the guns and the fronts. The numbers are according to the fronts and begin with the first one to the right of the exit of the main gate and continue with the sun. The advantage thus afforded is that it enables any particular gun to be specified, even if its number be unknown. Thus, the first gun on the right face of the second bastion, etc.

The relation which bastions bear to the general system of attack and defense is noticed under FORTIFICATION, where is given the historical development of methods of defense, illustrations, and a list of works treating this subject.

BASU'TOLAND. A British South African dependency, situated between the Orange Free State, Natal, and the Cape province, covering an area of 11,716 square miles (Map: Cape Colony, J 7). It has an elevated surface and a very rich soil, being considered one of the best grain-producing countries in South Africa. The climate is considered the most healthful in that section of the Continent. The principal products are cereals and live animals. Minerals are supposed to exist, judging from some indications, but so far coal is the only one

to be exploited. Basutoland is a member (since 1903) of the South African Customs Union. The imports consist chiefly of clothing and blankets, agricultural implements, metal products, and groceries. The imports and exports for the year 1908 amounted to £239,830 and £193,122 respectively. Basutoland is administered by a resident commissioner, under the High Commissioner for South Africa. It is divided into seven districts, subdivided into wards administered by hereditary chiefs. The administration of justice is also, to a very large extent, left in the hands of native judges. The revenue of the colony is derived chiefly from a native hut tax, license fees, post-office receipts, and an annual contribution from the Cape province. The revenue and expenditure for 1910-11 amounted to £145,500 and £134,888 respectively. Education is well advanced, and is carried on almost exclusively by missionaries. A railway from Maseru connects with the South African railway system.

The population of the colony was 404,507 in 1911. The natives (403,111) are a Bantu people, composed of several coalescent tribes, short in stature, regular in features, and with thinner lips than the Kaffirs, whom they resemble. They have advanced remarkably through the efforts of French missionaries and are becoming a civilized Christian nation, taking up readily modern ideas. Their language was reduced to writing by missionaries and forms a considerable literature. The capital of the colony is Maseru, with a population of about 861 natives and 500 whites. Basutoland was established as a separate state at the beginning of the nineteenth century by Moshesh, a powerful native chief, who clashed with the British government in 1852 and was worsted in the ensuing struggle. In 1856 a boundary dispute arose between the Basutos and the Orange Free State, which was continued for about two years without definite results. In 1866 a part of Basutoland was ceded to the Orange Free State, whose authority was recognized by the Basutos. But this settlement did not mark the termination of hostilities, which continued for several years. As the result of an appeal from the Basutos to Great Britain, Basutoland was annexed to Cape Colony in 1871. For the next 12 years the territory was in an almost uninterrupted state of rebellion, culminating in its disannexation from Cape Colony in 1884; since which time it has been administered under the direct authority of the crown. About four miles from Maseru a leper settlement was formed in 1912; the proportion of lepers in the territory is about .91 per thousand, and the disease is spreading. Consult: Mrs. Barkley, *Among Boers and Basutos* (London, 1900); Lagden, "Basutoland and the Basutos," in *Colonial Institute Journal*, vol. xxxviii (London, 1901); Bryce, *Impressions of South Africa* (London, 1899); Widdicombe, *Fourteen Years in Basutoland* (London, 1892); M. Martin, *Basutoland; Its Legends and Customs* (London, 1903); Lagden, *Basutos: the Mountaineers and their Country* (New York, 1910); Ellenberger, *History of the Basuto* (London, 1912).

BAT (OE. *back, balke*; cf. Swed. *natt-bakka*, nightjar, Dan. *aftenbakke*, evening bat, Icel. *lepr-blaka*, leather flapper, from *blaka*, flap, flutter). A small furry mammal of the order Chiroptera, having membranous wings and almost exclusively aerial in its habits. The power

of flight, which resembles that of birds or insects, is the distinguishing feature of these animals, which in most other respects resemble the Insectivora. Their whole organization has been modified towards the perfection and the pursuit of an aerial life. Most of them are small, though a few are of considerable size, and have a spread of wings measuring 5 feet.

Structure. The vertebral column is short and compact, the thorax capacious, to make room for the proportionately very large heart and lungs, and the breastbone (which is keeled like that of birds) and shoulder girdle are very large and strong to afford attachment to the great muscles operating the wings; while the pelvic girdle is small and weak. Reversing the rule among mammals, the fore limbs are developed vastly in excess of the hind ones, which, although provided with perfectly formed feet, are practically useless for locomotion on the ground, though of service in climbing, and particularly in clinging to some support, from which the creature hangs head down when at rest—its customary attitude of repose. The bones of the limbs are permeated by medullary canals so large as to make them practically hollow; other bones are light and slender, and the ribs much flattened.

Wings.—The modifications of the limbs with reference to flight are very great (see illustration). The shoulder bones (clavicle and scapula)

SKELETON OF BAT'S WING.

s, scapula; h, humerus; ur, ulna-radius; c, carpus (wrist bones); t, thumb; m, metacarpal bones; d, digits (fingers).

are much enlarged and strengthened. The humerus (*h*), though long, is scarcely two-thirds as long as the forearm, where the radius (*ur*) is so lengthened that in some species it is as long as the head and body together (the ulna is rudimentary and firmly soldered to the radius); the wrist or carpal bones (*c*) are compact, and more or less soldered together at the radial joint; the metacarpals (*m*, equivalents of the bones of the "back" of the human hand) are prolonged to lengths varying in the different families, but always equaling or exceeding the length of the body, and terminate in fingers (*d*) consisting of a varying number of phalanges. An exception to this, however, is made by the thumb (*t*), which is very short, free from the wing membrane, and terminated by a strong claw greatly used by the animal in climbing or holding on to a support. Thus the length of the arm and hand may be 15 or 20 times as great as the breadth of the shoulder.

The position of the bones is changed, so that, while ability for a rotatory motion is lost, greater power for an up-and-down (i.e., dorso-ventral) motion is gained. The hind limbs are also lengthened in the leg bones; but here the notable change is in the lateral position and spread gained through a twisting outward so extensive that the knee is directed backward in-

stead of forward. Upon this light, strong framework, moved and controlled by powerful pectoral muscles, is stretched a flexible, leathery, nearly hairless membrane (patagium), which is double and is really an extension of the skin. It envelops all the bones of the arm and hand and thence stretches to the hind leg (leaving the foot free) and in most families to, or nearly to, the end of the tail; but its relative size and shape vary. Stretching this great membrane and beating the air with it, the bat flies with more than the agility of a bird, though more slowly, and when it rests it folds the membrane somewhat like a fan against its sides, or wraps it about its body like a protecting mantle.

Sense Organs.—The brain and nervous system of bats are comparatively low in organization, but their sensory faculties are remarkably developed in adaptation to their crepuscular and nocturnal habits. "As blind as a bat" is a mistaken simile. All have efficient eyes, those of the Oriental fruit-eating sorts being of a size natural to their foxlike countenances. In our more familiar insect-eating species they are likely to be small, bead-like, and nearly hidden in the very soft fur with which these animals are clothed; the old English and German names, "fitting mice," were not bad ones. The senses of smell and taste are probably well developed. The sense of hearing is no doubt exceedingly acute and largely depended upon. All bats have prominent and very mobile ears, and in many of the insect eaters, the external ear expands in an enormous membrane, sometimes many times larger than the whole face, supplemented by appendages, ribbed, crinkled, and otherwise modified, and in some forms able to be folded down out of the way of harm. These expansive ears are evidently of more utility than simply to catch waves of sound and are related to the extraordinary sense of touch, which perhaps is carried to a higher degree of delicacy in these than in any other animals. In addition to them a large section of the order possesses "nose leaves"—more or less wrinkled and complicated upright growths of thin skin from the end of the nose, which often give to the face a most grotesque appearance. Two of the most extraordinary examples are shown on the accompanying Plate—the flower-nosed bat (Fig. 7), a native of the Solomon Islands; and Blainville's chin-leafed bat (Fig. 5) of South America. On the other hand, in some species such appendages are wholly absent, as in the ugly naked bat (Fig. 3) of the Malay countries.

All these membranes, as well as those of the wings, are filled with blood vessels and numerous ramifications of fine nerves, which take the form elsewhere seen in especially sensitive surfaces, and they are regarded as apprising the creature, in a way not fully understood, of the nearness of obstacles and giving other useful information. This was illustrated by the celebrated experiments of Spallanzani about 1775. He blinded bats with varnish and let them fly in a chamber filled with stretched and dangling strings. These and other obstacles they avoided; they turned corners, found holes for escape or concealment, and behaved as though eyesight were unnecessary; stoppage of the ears, however, caused them some embarrassment. Other observations have confirmed their ability, apparently through extreme sensitiveness of the exposed membranes, to sense objects without sight or actual touch.

Distribution. Bats are distributed in all

parts of the world and, as might be expected from their powers of flight, inhabit many remote islands, such as Bermuda and New Zealand—the only indigenous mammals of the latter being two species of bats. They are absent, however, from the coldest parts of the world and are most numerous in the Eastern tropics, to which some groups are confined; in fact, the race is characteristically tropical. In rather cold climates, such as that of Canada, some species have acquired a habit of migration, going south to some extent in the autumn, as the northern winters are too long to be survived in a state of uninterrupted hibernation. This seems to be the case, according to Merriam, with two species of North American bats, both of which habitually rest in trees instead of in the warmer recesses of caves. The number of kinds of bats is so great that about 450 species are now recognized; and the enormous companies of certain species that congregate in favorable places are unrivaled elsewhere among gregarious mammals and recall the great flocks of sea birds to be seen in certain nesting localities.

Ancestry. Few fossil remains of bats are known. In the Upper Eocene deposits of Aix, France, has been found a well-developed bat's wing, and in other portions of the Tertiary deposits of the same country have been found skulls of species that very closely resemble those of modern forms. In North America their remains are known in fragmentary condition from the Eocene, Miocene, and Post-Tertiary deposits, and in South America they have been recognized in the cave deposits of Brazil. All these differ little from living genera.

Classification and Habits. Bats are classified as an order, divisible into two sections, Megachiroptera and Microchiroptera.

Megachiroptera.—These are lowest in rank and include the large-sized, fruit-eating species, mainly of the Oriental tropics. The lowest in rank are the fox bats or "flying foxes" of the family Pteropodidæ. They are described under the titles FOX BAT and FRUIT BAT.

Microchiroptera.—In this division are found all other bats—the ordinary bats of temperate climates as well as many tropical ones—which agree in being of small size, in living, as a rule, upon insects to which their dentition is suited, and in having more or less of a tail enveloped in an interfemoral membrane. The first family is that of the horseshoe bats (Rhinolophidæ), whose snouts bear such appendages as have been described, differing according to species. They are scattered throughout southern Asia, where many species are well known, and a few extend into Europe and the British Isles. Most of them are of the ordinary brown color, but an Australian species is bright orange in the male and yellow in the female. A family having still more prominent growths about the nose and ears is that of the leaf-nosed bats proper (Nycteridæ). Two genera inhabit eastern Asia, represented by the lyre bat (*Megaderma lyra*), whose vast ears are joined together above the head, and which sometimes attacks and kills other bats and small mammals and, according to good authority, frogs, sucking their blood. In the next family, Vespertilionidæ, are grouped the "true," or familiar, small, naked-faced bats of all countries. They feed almost exclusively on insects, which they capture in flight, and which their sharp and numerous teeth are fitted to hold and crush; they spend the hours of daylight in

BATS

2. TUBE-NOSED FRUIT BAT (*Harpyia*).
3. MALAYAN MASKED BAT (*Cheiromeles torquatus*).
4. INDIAN FALSE VAMPIRE (*Megaderma lyra*).

5. CHIN-LEAFED BAT (*Mermops megalophylla*).
6. AMERICAN FALSE VAMPIRE (*Vampyrus spectrum*).
7. FLOWER-NOSED BAT (*Anthops ornatus*).
8. HAMMERHEAD (*Hypsignathus monstrosus*).

eaves, ruins, hollow trees, garrets, and similar hiding places, sometimes resorting to caverns in vast numbers and so continuously that thick deposits of valuable guano are formed, as is the case in certain parts of Texas. At dusk they sally forth, alone or in pairs, and hunt the air for their minute prey. In cold climates they spend the winter hanging in some retreat (each species exercising a preference in this matter) in a semi-torpid state and occasionally appear during warm spells. One, or sometimes two, young are born in the spring, and carried about clinging to the mother's breast, where two nipples yield milk. The commonest European bats, in regard to which much folklore and no little of foolish superstition are related and still believed among the ignorant, are the long-eared (*Plecotus auritus*), the barbastelle (*Barbastellus communis* or *Synotis barbastellus*), the pipistrelle or flittermouse (*Vesperugo pipistrellus*), abundant all over Europe and Central Asia, and the serotine (*Vesperugo serotinus*), which is almost world-wide in its distribution. Here belong also the common North American bats, of which the most frequently seen in the northern United States are the little brown bat (*Vesperugo [or Myotis] subulatus*) and the red bat (*Lasiurus borealis*). All these have a long tail extending a spacious triangular membrane, which is further sustained by two bones springing from the "heels" of the hind feet, and which serves a most useful purpose in these dodgings through the air so characteristic of the bat's flight.

The remainder of the bats form the Emballonurine section of the group. The typical family, Emballonuridae, consists of small tropical and subtropical species of both hemispheres, which have a naked muzzle, in which the nostrils project beyond the lower lip, and a tail sometimes longer than the interfemoral membrane. Many are South American. One section embraces the molossine, or mastiff bats, of which a sooty brown species dwells in southern California. They are noted for the thickness and freedom of the hind limbs and tail. Another family, the Phyllostomatidae, is confined to Central and South America, where it represents the nose-leaved bats of the Old World, having many appendages about the nostrils. Many of them eat fruit or suck the blood of animals as well as feed upon insects, and one, called *Vampyrus spectrum*, is the largest and most repulsive of American bats; it is a fruit eater. (See Colored Plate of MAMMALIA and Plate of BATS.) Here, however, are classed the true vampires of the genus *Desmodus*. See VAMPIRE.

Bibliography. For the bats of the Old World, consult the standard works, and Dobson, *Catalogue of the Bats in the British Museum* (London, 1878); for North American species, Merriam, *Transactions, Linnæan Society of New York*, vol. i (New York, 1882); Allen, *Bats of North America*, Bulletin No. 43, U. S. National Museum (Washington, 1893); and the writings of Waterton, Gosse, Bates, Belt, Wallace, Poey, and Hudson for bats of tropical America. Nat. Museum, *Bulletin* (Washington, 1907); Hahn, "Some Habits and Sensory Adaptations of Cave-Inhabiting Bats," in *Bulletin*, Marine Biological Laboratory, vol. xv

(Lancaster, Pa., 1908). See FRUIT BAT; HAMMERHEAD BAT; HARRY BAT; LYRE BAT.

BATABANÓ, bá-tá'ba-nó'. A town of Cuba, situated in the province of Havana, on the south coast of the island, 37 miles by rail from Havana (Map: Cuba, C 4). This port is one at which coasting steamers touch, and is the nearest point in Cuba to the Isle of Pines. The natives are engaged in sponge fishing. Diego Valesquez in 1514 founded San Christóbal de la Habana on the present site of Batabanó. Pop., about 6500.

BATAC, bá-ták'. A town of Luzon, Philippines, the largest in the province of Ilocos Norte, 10 miles south of Laoag. It was founded in 1587 and is a flourishing trade centre. Pop., 1903, 19,524.

BATAK, bá'tik. A nomadic pygmy tribe living in the vicinity of Tinitian, Palawan Island. They are of lighter complexion than the Negrito and show other evidences of being mixed bloods. Although they sometimes practice agriculture in a crude fashion, they subsist chiefly on forest products and the game they are able to secure with their blowgun and poisoned darts. See PHILIPPINES.

BATALEUR, bá'tá'lér'. See EAGLE.

BATAN, bá'tán. A town of Panay, Philippines, in the province of Capiz, 17 miles west of Capiz. Pop., 1903, 14,315.

BATANÆA. See BASHAN.

BATANES, bá-tá'nás. A Malayan people inhabiting the Batanes Islands, which lie between Luzon and Formosa. Their dialects belong to the Philippine group of languages. See PHILIPPINES.

BATANGAS, bá-tán'gás. A seaport town, the capital of the province of the same name, on the island of Luzon, Philippines (Map: Luzon, F 12). The province covers an area of 1108 square miles on the peninsula opposite the island of Mindoro and had a population, 1903, of 257,715. It contains a number of high mountains and Lake Binabon, or Taal, with the volcanic mountain of Taal in its centre. The province produces extensively sugar, coffee, rice, hemp, corn, oranges, bananas, and coconuts. There are forests of pine wood on the mountains, and the region is rich in mineral waters. The only important industry is the manufacture of dye-stuffs, and silk, abaca, and cotton fabrics. The capital of the province, 72 miles south of Manila, lies at the mouth of the Calumpang River, on the east shore of Batangas Bay. It has a fine harbor. The city is well built, and among its prominent buildings are a royal palace, a prison, and a convent. A number of annual expositions are held in the city. Pop., 1903, 33,131.

BATAN (bá'tán) **ISLANDS** (Sp. *Islas Batanes*). A group of islands in the northern part of the Philippine Archipelago, situated north of the Babuyan group, between lat. 20° and 21° N. (Map: Philippine Islands, F 1). The principal islands are Ibayat, 35 square miles; Sabtan (Seminanga), 12; and Batan, 27 square miles. The total area of the group is 81 square miles. The population is about 10,000. Administratively the group forms a subdivision of Cagayan Province, with Santo Domingo de Basco (2347) on Batan as capital.

BATATAS, bá-tá'tás. See SWEET POTATO.

BATAVI. The name of a German people who anciently inhabited a part of the present Holland, particularly the island which is called after them, Insula Batavorum. Their cavalry

was particularly good, and was often employed by the Romans. Their capital was Lugdunum Batavorum, now called Leyden. The first writer who terms the insular district inhabited by the Batavi, Batavia, is Zosimus.

BATAVIA, *Dutch pron.* bâ-tâ-vê-â. Properly the name of the island occupied by the ancient Batavi. At a later date it became the Latin name for Holland. The name BATAVIAN REPUBLIC was given to the Netherlands on their new organization by the French in May, 1795, and they continued to bear it till they were converted into the Kingdom of Holland, under Louis Bonaparte, in June, 1806.

BATAVIA (*Batavia*, 'good land,' the ancient name of modern Holland, the motherland of the city in Java). The capital and chief city of the Dutch East Indies. It is situated on the north coast of Java, in lat. 6° 7' S. and long. 106° 50' E. (Map: East India Islands, C 6). It lies on the Bay of Batavia in a low and marshy plain, which is mainly devoted to the cultivation of rice. The temperature is warm and approximately uniform. Like most Colonial cities, Batavia consists of two parts, the old and the new city. The former is situated near the water and is occupied chiefly by business houses and factories and the residences of the natives and Chinese. In former years the Europeans also lived in the lower part of the city, but the excessive mortality from fever compelled them to remove to the upper and more elevated part. The modern city is built after the fashion of Dutch towns, with a few modifications to suit the exigencies of the climate. Streets and canals intersect, and houses are spacious and wide apart and are surrounded by luxurious gardens filled with the choicest tropical plants. The government buildings are of magnificent architecture. The Königs Plein is a parade ground one square mile in extent and surrounded by beautiful residences and fine public buildings, including the Governor-General's palace and the Museum of the Batavian Society of Arts and Sciences. The latter is a beautiful structure in Greek style, and contains, besides an extensive library, the largest collection of representative Javanese art in all its branches. The Batavian Society, in conjunction with the Dutch government, has contributed considerably to the science of archaeology by the excavation of the ancient Javanese temples. The military buildings are extensive and well built. In regard to public utilities, Batavia is in no way inferior to any European city of its size. It has good steam tramways, electric railways, telephones, electric lighting, and all other accessories of a modern city. Among its educational and charitable institutions are a gymnasium, a number of government and private high schools, an orphan asylum, a medical school for natives connected with the military hospital, and a number of scientific societies. Commercially Batavia is the most important city of the East Indies. It is the chief outlet for the numerous products of the Dutch East Indies, of which the most important are coffee, sugar, tea, rice, different spices, timber, dyewoods, diamonds, drugs, minerals, etc. Batavia stands in direct communication with the Netherlands, Great Britain, Germany, and Australia. A state railway connects the old town with the harbor, and a private line runs into the interior. About 36 miles south of the city is Buitenzorg, the residence of the Governor-General.

The first European settlement on the site of the present city of Batavia was founded by the Governor-General Pieter Both, in 1610. Originally only a factory, it became the chief commercial centre of the Dutch East Indies, under the name of Jacatra, during the administration of the Governor-General, Coen (1618-32), who removed his seat from the Moluccas to the new settlement and erected some fortifications. In 1619 it was attacked by the joint forces of the kings of Bantam and Jacatra, assisted by the English, who were defeated, after a siege of five months, by Governor-General Coen. Since then the city has been known by its present name, and has grown rapidly, becoming by the end of the seventeenth century the foremost city of the East Indies. After the eruption of Mount Salak in 1699 the streams were choked with mud, the site became very unhealthful, and the centre of European population gradually shifted southward, where the modern city of Batavia is situated. The inhabitants of Batavia in 1900 numbered 115,887, of whom 9423 were Europeans, 26,433 Chinese, and 2828 Arabs. An enumeration in 1905 returned a total population of 138,551, of whom 8777 were Europeans, 99,320 natives, 28,150 Chinese, and 2058 Arabs. Batavia is the seat of a United States consul. Consult Conscience, *Batavia* (Paris, 1880).

BATAVIA. A city in Kane Co., Ill., 44 miles west of Chicago, on the Chicago, Burlington, and Quincy and the Chicago and North-western railroads and on Fox River (Map: Illinois, D 2). It manufactures windmills, engines, pumps, wagons, and foundry products and also has important limestone-quarrying interests. Batavia was settled in 1833 and is governed under a charter of 1902, which provides for a mayor, elected biennially, and a unicameral council. Pop., 1900, 3871; 1910, 4436.

BATAVIA. A town, and the county-seat of Genesee Co., N. Y., 36 miles (direct) east of Buffalo on the New York Central, the Erie, and the Lehigh Valley railroads, and on Tonawanda creek (Map: New York, B 4). It is the seat of the State School for the Blind and has a public library, the Holland Purchase Museum and Land Office, which contains relics of the early history of this part of the State, good public and parochial schools, and an anti-masonic monument. The town is an important manufacturing centre, producing agricultural implements, shotguns, shoes, rubber tires, paper boxes, carriage wheels, shell goods, and interior woodwork. The water works and electric light plant are owned by the municipality. Pop., 1910, 11,613. Batavia was founded by Joseph Ellicott in 1801 and incorporated as a village in 1823. Here lived William Morgan (see ANTI-MASON), who is said to have been abducted and killed by members of the Masonic Order in 1826 because of his intention to reveal the secrets of Masonry. Consult Seaver, *A Historical Sketch of the Village of Batavia* (Batavia, 1849).

BATCHELLER, GEORGE SHERMAN (1837-1908). An American soldier, jurist, and diplomat, born at Batchellerville, N. Y. He graduated in 1856 at the law department of Harvard University, was admitted to the bar in 1858, and was elected a member of the New York State Legislature in 1859, 1873, 1885, and 1889. During the Civil War he served in the Virginia campaigns, and at the siege of Charleston was appointed deputy provost-marshal-general of the Department of the South, and rose to be lieu-

tenant colonel of volunteers. In 1875 he became judge, representing the United States in the international tribunal of Egypt, and was elected presiding justice. After having been, in 1889-90, First Assistant Secretary of the Treasury, and in 1891 Minister to Portugal, he was reappointed to the international tribunal in 1897 and again in 1902.

BATCH'ELOR, GEORGE (1836-). An American Unitarian minister. He was born at Southbury, Conn., and graduated at Harvard College, the Meadville Theological School (1863), and was secretary of the American Unitarian Association from 1894 to 1898, of the National Conference from 1870 to 1880, and chairman of that body in 1893-94. He was editor of the *Christian Register* from 1897 to 1911. Besides numerous sermons he published, in 1887, *Social Equilibrium*.

BATCHIAN, băt-shyân'. See BATJAN.

BATE, WILLIAM BRIMAGE (1826-1905). An American soldier and legislator. He was born near Castilian Springs, Tenn. He served as a volunteer during the Mexican War and afterward edited a newspaper at Gallatin, Tenn., where he also began to practice law in 1852. Previously he had been sent to the State Legislature, and from 1854 to 1860 held the office of Attorney-General for the Nashville District. He joined the Confederate army as a private and rose to the rank of major general. The confiscation of his property while he was still in the army left him penniless, and he had personal obligations amounting to \$30,000, but he declined to take advantage of the bankruptcy law and had paid the amount in full by 1882.

BATEAU, bâ'tô'. See BOAT.

BATEMAN, SIR ALFRED EDMUND (1844-). An English economist and public official. He was born in Nottinghamshire and received his education at Repton and at Brighton College. After allying himself with the ecclesiastical commissioners (1863) and the board of trade (1865), he studied law and in 1872 became a barrister. He served as secretary successively to the French commissioners of treaty negotiations (1877, 1881, 1882), to the international sugar conferences (1887-89), and to the trade and treaties committee (1890-92). In 1892, and again two years later, he was British delegate for the Portuguese and Spanish commercial negotiations. In 1897 he was president of the Royal Statistical Society, and in the same year he was appointed treasurer of the International Statistical Institute, serving in this position until 1909. For a time he was Comptroller-General for commerce, labor, and statistics at the British board of trade, and later he served as joint manager of the Imperial Institute, as chairman of the labor arbitration courts, and as chairman of the London advisory committee of labor exchanges. He received a jubilee medal in 1897 and three years later was created a K.C.M.G.

BATEMAN, SIR FREDERIC (1824-1904). An English physician and scientific writer. He graduated at the University of Aberdeen in 1850 and in 1876 was elected fellow of the Royal College of Physicians. His appointments included that of consulting physician to the Norfolk and Norwich Hospital. His *Aphasia and the Localization of Speech* (1870) was crowned by the Academy of Medicine of France. He published also *Darwinianism Tested by Language* (1877) and *The Idiot and his Place in Creation*.

BATEMAN, KATE JOSEPHINE (MRS. CROWE) (1842-). An American actress. She was born at Baltimore, Md., the daughter of Heczekiah Linthicum Bateman, an actor and theatrical manager. Her mother was also an actress. With her sister, Ellen (later Mrs. Greppo), she appeared on the stage almost in infancy and exhibited unusual talent. In 1862 she began her career in New York as Julia, Pauline, Juliet, and Lady Macbeth, and made a remarkable success in London in 1863 as Leah. She married George Crowe, the former editor of the London *Daily News*, in 1866, and temporarily abandoned the stage, but returned to it in 1868, making a success in *Medea* in 1872, and with Henry Irving in *Macbeth* in 1875. The next year she played the title rôle in Tennyson's *Queen Mary*. In and after 1892 she conducted a school of acting in London and appeared in subordinate rôles in many well-known plays.

BATEMAN, NEWTON (1822-97). An American educator. He was born at Fairfield, N. J., graduated in 1843 at Illinois College, studied at Lane Theological Seminary, and from 1847 to 1851 was professor of mathematics at St. Charles College, Missouri. He was principal of the Female College at Jacksonville, Ill., from 1851 to 1857. From 1858 to 1868 he was State superintendent of public instruction for Illinois, and from 1875 to 1893 was president of Knox College. Besides these official activities he was interested in many educational societies.

BATES, ARLO (1850-). An American author. He was born at East Machias, Me., and was graduated from Bowdoin (1876). He became the editor of the Boston *Sunday Courier* (1880-93) and afterward professor of English in the Massachusetts Institute of Technology. Among his novels are *The Pagans* (1884), *The Wheel of Fire* (1885), *The Philistines* (1888), *The Puritans* (1899), and *Love in a Cloud* (1900). His poems are collected in *Berries of the Brier* (1886), *Sonnets in Shadow* (1887), *A Poet and his Self* (1891), *Told in the Gate* (1892), *The Torchbearers* (1894), and *Under the Beech Tree* (1899); his criticisms in *Talks on Writing English* (1897), *Talks on the Study of Literature* (1898), *The Diary of a Saint* (1902), *Talks on Teaching Literature* (1906), and *The Intoxicated Ghost* (1908). In 1912 he wrote an introduction for E. P. Whipple's *Charles Dickens* (2 vols.).

BATES, BLANCHE (1873-). An American actress, born at Portland, Ore. She made her début in San Francisco in a benefit performance of Brander Matthews's *This Picture and That*. Among her early successes were her Mrs. Hillary in *The Senator*, Phyllis in *The Charity Ball*, and Nora in *A Doll's House*. She joined Daly's company in 1898 and the next year at Daly's Theatre, New York, played Mirtza in *The Great Ruby*. In 1901 she appeared as Cigarette in *Under Two Flags* at the Garden Theatre in New York. Thereafter devoting herself to the productions of David Belasco, she won great success in *The Darling of the Gods* (1902) and *The Girl of the Golden West* (1905). Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899).

BATES, CHARLEY. A pupil of the Jew Fagin, and companion of the "Artful Dodger," in Dickens's *Oliver Twist*.

BATES, CHARLOTTE FISKE (MME. ROGÉ) (1838-). An American writer, born in New York City. She published a volume of verse,

under the title *Risks and Other Poems* (1879), contributed many articles to magazines, and edited the *Longfellow Birthday Book* (1881), *The Seven Voices of Sympathy* (1881), and the *Cambridge Book of Poetry and Song* (1882). In editing the first-named works she cooperated with the poet Longfellow, whom she also assisted in compiling his *Poems of Places*. In 1891 she married M. Adolphe Rogé, who died in 1896.

BATES, EDWARD (1793-1869). An American lawyer and statesman. He was born in Belmont, Va., of Quaker parentage. He was appointed judge of the St. Louis land court in 1853, presided over the Whig National Convention in 1853, and subsequently became one of the leaders of the Republican party. At the national nomination convention in Chicago in 1860 his name was proposed for the presidency, and he received 48 votes on the first ballot. From 1861 to 1864 he was a member of Lincoln's cabinet as attorney-general, and worked indefatigably to secure the success of the Union cause during the Civil War. Afterward, until his death, he devoted himself wholly to the practice of his profession.

BATES, HENRY WALTER (1825-92). An English naturalist and traveler, born at Leicester. He became acquainted with A. R. Wallace, and in 1848 he and Wallace went to the Amazon, paying their expenses by the sale of duplicate specimens. Bates spent three years at Pará and seven years on the upper Amazon. At Ega, on the upper Amazon, he found 550 new species of butterflies. He returned to England in 1859, having found 8000 species new to science. Like Darwin, he suffered much from dyspepsia after his return, but published *The Naturalist on the River Amazon* (London, 1863), a work which has become a classic. In his "Contribution to Insect Life of the Amazon Valley: Lepidoptera; Heliconidae" (*Linn. Soc. Trans.*, vol. xxiii, London, 1862), he considers the phenomenon of mimicry and gives a philosophical explanation of it. After reading it, Darwin wrote: "I rejoice that I passed over the whole subject in the *Origin*, for I should have made a precious mess of it." In 1864 he was made assistant secretary of the Royal Geographical Society, a position entailing much executive work, which he administered with great credit. He edited several of the *Transactions*, as well as many books, including *Belt's Naturalist in Nicaragua*. He was elected a fellow of the Royal Society in 1881. He married Sarah Ann Mason in 1861. A large part of his collections are in the British Museum. Consult *The Field*, London, Feb. 20, 1892.

BATES, JOHN COALTER (1842-). An American soldier, born in St. Charles Co., Mo. He was educated at the Washington University in St. Louis, and joined the Federal army in 1861 as a lieutenant in the Eleventh Infantry. He was on General Meade's staff from Gettysburg to the close of the war, was made a colonel of the Second United States Infantry in 1892. He served for 30 years chiefly in the Indian country. At the outbreak of the war with Spain he was a brigadier general of volunteers, and he was promoted to the rank of major general of volunteers during the Santiago campaign. He was military governor of Cienfuegos in 1899 and went that year to the Philippines, where he conducted the negotiations with the Sultan of Sulu. In April, 1900, he commanded the depart-

ment of southern Luzon. He was made a brigadier general in February, 1901, a major general in July, 1902, and in February, 1906, lieutenant general and chief of staff, to succeed General Chaffee. The following April he retired.

BATES, JOSUUA (1788-1864). An American financier, born at Weymouth, Mass. In 1828 he became associated with the great house of Baring Brothers & Co., of London, of which he eventually became the senior partner. He was umpire of the commission convened in 1853 to arbitrate the claims of American citizens arising from the War of 1812. In 1852 he founded the Boston Library by giving \$50,000 for that purpose, with the provision that the interest of the money should be expended for books of permanent value, and that the city should make adequate provision for at least 100 readers. He afterward gave 30,000 volumes to the institution, the main hall of which is named "Bates Hall" in his honor. Consult *Memorial of Joshua Bates* (Boston, 1865).

BATES, KATHARINE LEE (1859-). An American author, born at Falmouth, Mass. She graduated at Wellesley College (1880) and taught there after 1885, becoming professor of English literature in 1891. She wrote: *Rose and Thorn* (1889), juvenile stories; *Hermit Island* (1891), a story for girls; *The College Beautiful and Other Poems* (1887); *The English Religious Drama* (1893, 1902); *A History of American Literature* (1898); *Spanish Highways and Byways* (1900, 1912); *From Gretna Green to Land's End* (1907); *Story of Chaucer's Canterbury Pilgrims* (1909); *America the Beautiful and Other Poems* (1911); *In Sunny Spain* (1913). She edited many texts, including *Early Poems of Alice and Phæbe Cary* (1903) and Tennyson's *Princess* (1904), and prepared, with Lilla Weed, *Shakespeare; Selective Bibliography and Biographical Notes* (1913).

BATES, LINDON WALLACE (1858-). An American civil engineer, born at Marshfield, Vt., and educated at Yale College. After the completion of engineering studies he was appointed assistant engineer for the Northern Pacific and Oregon Pacific railways, and subsequently was contracting engineer or manager of a number of important contracts in connection with the building of transcontinental railways. His advisory services were employed by the governments of Belgium, Great Britain, and Russia in such large undertakings as the improvement of the port of Antwerp, the enlargement of the Suez Canal, and the increasing of Black Sea harbor efficiency. For the authorities of Queensland, South Australia, and India he designed a number of harbors and planned the regulation of several rivers. A scheme for the improvement of the port of Shanghai was also prepared by him, working in cooperation with other engineers of international reputation. In the United States one of Bates's big contracts was the raising of the grade at Galveston after the flood there, and it was he who designed the "three-lake" plan for the Panama Canal. In 1900 the French government conferred on him a *Grand Prix* and decoration for "distinguished services to science"; and he was chosen to membership in various foreign as well as American engineering societies. He wrote: *The Navigation Interests of Nations in Ports and Waterways* (1900; Fr. trans., 1900); *The Panama Canal* (1905); *Retrieval at Panama* (1907).

BATES, SAMUEL PENNIMAN (1827-1902).

An American educator and writer, born in Mendon, Mass. He graduated at Brown University in 1851. In 1860 he was made deputy State superintendent of schools and in 1866 State historian of the State of Pennsylvania. His numerous lectures and reports did much to further the cause of education. He published: *Lives of the Governors of Pennsylvania* (1873); *Life of Gen. O. B. Knowles* (1878); *Battle of Gettysburg* (1878); *Battle of Chancellorsville* (1882). His educational works include *Lectures on Moral and Mental Culture* (1860), *Liberal Education* (1865), *Method of Teachers' Institutes* (1862), and *History of Colleges in Pennsylvania*.

BATE'S CASE. At the beginning of his reign James I. of England, following the bad example set by Mary and Elizabeth, laid duties or "impositions" on certain goods, including currants and tobacco, without securing a parliamentary grant. In 1606 John Bate, a London merchant and member of the Levant Company, refused to pay these charges on a cartful of currants and was promptly committed to the Marshalsea for contempt of the King's officers. The Commons sided with Bate; but the King's "sole prerogative" to levy impositions on exports and imports was declared by a unanimous decision of the barons of the Court of Exchequer. An unconstitutional practice was thus sustained by a decision which is generally regarded as wrong. The Bate Case is, therefore, an incident of great historical significance, marking the beginning of the long and bitter struggle with the Stuarts to maintain the constitutional right of Parliament to grant all supplies. Consult Gardiner, *History of England*, vol. ii (London and New York, 1889).

BATES COLLEGE. An undenominational institution for both sexes, at Lewiston, Me., opened in 1863, chartered in 1864, an outgrowth of Maine State Seminary, chartered in 1855. Bates was the first Eastern college to afford collegiate education to women, and her first woman graduate, 1869, became a professor in Vassar College. Abstinence from intoxicating drinks is a condition of student membership. The courses of study cover the usual range of undergraduate work. All candidates for degrees (A.B. and B.S.) make their selections of subjects under a system of majors and minors arranged in three groups—languages, philosophy, sciences. Alone among New England colleges Bates has no secret fraternities. It has 15 buildings and well-equipped chemical, physical, and biological laboratories. The libraries contain about 40,000 volumes. The campus covers 60 acres and with the buildings has a value of upward of \$500,000. The invested funds amount to \$760,000. The college has 99 scholarships and shapes its entire policy with a view to aiding students of limited means. In 1913 it had 33 officers and instructors and 450 students. Bates has won special distinction by the success of her students in intercollegiate debates—27 victories in 32 contests. Of the 1839 graduates, about 43 per cent have become educators. President, George C. Chase, D.D.

BATESVILLE, bāts'vil. A city and the county-seat of Independence Co., Ark., 114 miles by rail north by east of Little Rock, the State capital, on the White River, and on the St. Louis, Iron Mountain, and Southern Railroad (Map: Arkansas, D 2). The city has transportation facilities by water, as the White River is navigable for a considerable portion of the

year. A system of locks and dams, estimated to cost \$1,000,000, has been built by the Federal government to insure permanent navigation for a distance of about 100 miles above the city. Seven more, to cost \$2,000,000, are contemplated. Batesville is the seat of Arkansas College (Presbyterian), opened in 1872, the Masonic Home and School, and the Odd Fellows Home and School for Widows and Orphans. It has extensive quarries of manganese ore, phosphate rock, sandstone, limestone, and marble; makes large shipments of building stone, cotton, and lumber; and manufactures staves, flour, lumber products, carriages, wagons, etc. The water works and electric light plant are owned by the municipality. Pop., 1890, 2150; 1900, 2327; 1910, 3399.

BATFISH. 1. One of the small, pediculate fishes of the family Malthidæ, related to the angler or fishing frog. The commonest American species is *Malthe* (or *Ogcocephalus*) *vespertilio*, the sea bat or diablo of West Indian waters, which is grayish brown above, covered with bony tubercles, and reddish below, and abounds in the warmer regions of the Atlantic, where it sits on the bottom, supported by its fins, much in the attitude of a toad. Its remarkable abnormality arises from the excessively large and broad head compared with the short, slender trunk and the leg-like form of the pectoral fins. It is regarded as venomous by the ignorant. It has curious relatives in the deep sea. For illustration, see Plate of ANGLERS AND BATFISH. 2. One of the sting rays of the Pacific coast (*Myliobatis californicus*). (See RAY.) 3. A flying fish (q.v.). 4. A flying gurnard of the Atlantic (*Cephalacanthus spinarellus*). See GURNARD.

BATH, bath. By bathing is usually understood the immersion of the body, or a part of it, in water. In a more extended signification it means the surrounding of the body with any medium differing in nature or temperature from its usual medium; thus we speak of a vapor bath, a cold-air bath, an earth bath. A four-fold division may be made of baths: (1) According to the substance with which the body is surrounded—whether liquid, gaseous, or mixed, water, oil, wine, milk, blood, gas, sand, mud, and other baths; (2) according to the manner of application—into river, plunge, shower, dropping, vapor, electric, and douche baths; (3) according to the parts of the body subjected to the application—into whole, half, sitz, foot, and eye baths; and (4) according to the temperature of the substance applied—into cold, tepid, warm, and hot baths.

The most ancient historical accounts as well as popular myths make mention of bathing. Among the Egyptians the bath was practiced as a religious rite; and in general we find the opinion prevailing, throughout antiquity, that purification of the body symbolized moral purity. In making the bath a religious ordinance, Moses may have had in view the prevention or more speedy cure of those skin diseases so prevalent in the East. The Mosaic law prescribes expressly, in some cases, the use of running water, which has given rise, through a misunderstanding, to the deleterious cellar baths of the Jews. In Palestine the wealthier Jews had private baths in their houses, and ponds in their gardens—an arrangement which prevailed in all the civilized parts of the East, and still obtains. There were, besides, public bath houses among the Jews, as among other nations.

Greece. Among the Greeks, also, bathing was very early in use. They early used both fresh water and salt, took advantage of natural hot springs, and employed water artificially heated. A bathroom containing a clay tub was found in the prehistoric palace at Tiryns, and in Homer the warm bath is frequently used for refreshment and is part of the entertainment offered an honored guest. Bathtubs, for which water was heated, were used, and the washing was followed by an anointing with oil. Bathing among the Greeks was a religious rite and was connected with the preparations for sacrifice, for the reception of oracles, for marriage, etc. It was at Athens that the luxury of warm baths was especially developed after the fifth century B.C. There were public baths where a slight fee was required, baths conducted by private enterprise at higher rates, baths in the wealthy private houses, and others connected with the gymnasia. The Athenians knew the vapor, hot, plunge, and douche baths preceding the cold baths. Allusions in the ancient writers, as well as scenes on the vase paintings, show that the bathers frequently stood beside a large basin on a high stand. We also find men and women bathing under douches, the water pouring from spouts in the wall. There were swimming baths for each sex, but there is no reason to believe that the later Roman custom of promiscuous bathing ever prevailed in Greece. The baths never reached such splendor of construction or such importance in the daily life of the Greeks as they did in that of the Romans.

Rome. Among the Romans the public baths were long the only ones in use and consisted of but two halls, one for each sex. Every town and even village had one bath or more. In Rome itself there were over 800 in the fourth century A.D. This number does not include the magnificent imperial *thermæ*, which were much more than baths; nor the private baths, without which no house of any pretensions was complete. At first the Romans bathed but seldom; Seneca says they washed their arms and legs every day, their whole bodies once a week. Scipio Africanus Maior had a warm bath in his villa at Liternum. Sergius Orata, about a century before Augustus, was the first to make a bathroom over a *hypocaust*, or basement filled with hot air—a discovery which was developed into a system of hot-air chambers beneath the floor and in the side walls of the *calidarium*, or room for the hot bath, giving an even, hot temperature. Probably the increase of comfort due to this invention was the cause of the growth in both the number and the popularity of baths towards the close of the republic. Mæcenæ was the first to have a swimming tank of hot water, and Agrippa was the first to build immense *thermæ* on an elaborate and systematic plan, with all the luxuries of Græco-Oriental tradition improved by Roman practical inventiveness. The type of the Augustan age can be studied in the descriptive text of the Roman architect Vitruvius. The later Imperial *thermæ* became the centre of the public leisurely life of Rome, including libraries, lecture rooms, gardens, porticoes, gymnasia, running tracks, and every variety of incentive to luxurious ease. They were thus combinations of the Greek gymnasia and elaborate bathing establishments. The principal Imperial establishments of this kind were those of Titus, Trajan, Caracalla, and

Diocletian. They covered enormous spaces in the heart of the city.

It is worth while to note that the Romans called a bathing vessel *balneum*. Later, they applied this word, or *balineum*, or *balnearium*, to a bathroom, properly to a simple room in a private house. The plural forms, *balneæ* and *balineæ*, were applied to the ordinary public baths. The term *thermæ*, which properly denoted hot springs, was used of the luxurious bathing establishments of the Imperial age, described above.

The system of bathing in all the various classes of bathing establishments was fundamentally the same, except when special treatment was prescribed by medical advice. Galen recommended the following succession: (1) hot-air bath in laconicum, or sweating room; (2) hot-water bath; (3) cold bath; (4) massage. That other great physician, Celsus, recommended: (1) sweating, dressed, in tepidarium; (2) sweating, disrobed, in calidarium; (3) douche bath, first hot, then tepid, then cold; (4) scraping, rubbing, and anointing. The essential parts of the bathing establishments were: (1) a vestibule for loungers, servants, and attendants, and sometimes an atrium; (2) an undressing room, or apodyterium, though often the bathers undressed in the larger bathing rooms; (3) the frigidarium, or hall for cold baths, with a sunken basin at one end or in the centre, often large enough for a swimming tank; often the bathers contented themselves with the cold bath; (4) the tepidarium, a hall not used for bathing, but kept at a moderate temperature to serve as transition between the hot and the cold bathrooms, used for dressing and undressing, anointing and waiting; it was fitted out with a sunken tank for hot water at one end, and a raised basin at the other for cold water; (5) the calidarium, or hall for hot baths; under it was the hypocaust, or hollow floor filled with hot air from the furnace, which was conveyed also into the hollow walls around the calidarium. With the furnace were connected three boilers, the lower one containing hot water, the middle one warm, and the upper cold water, so connected by pipes that when hot water was drawn off from the lower boiler it was replaced by tepid water from the one above, and that again by cold from the uppermost. The scraping off of the perspiration by strigils, and the anointing with oil, which at first took place in the calidarium, were afterward transferred to the tepidarium, or to a special hall called the unctorium, the last hall toward the exit. Connected with the calidarium was the laconicum, or sweating room.

There are many remaining examples of Roman baths of the various classes. Those at Pompeii form the most interesting and varied group outside of Rome. That of the Villa of Diomedes shows the type followed in the wealthy private house (open-air bath; dressing room; frigidarium; tepidarium; calidarium); the public ancient baths, which show two complete sections, one for each sex, show the normal plan of the age of Vitruvius, before the development of the elaborate Imperial *thermæ*. (Consult Mau-Kelsey, *Pompeii*, New York, 1902.) One of the best preserved of these public baths of moderate size is in Germany, at Badenweiler, also with its two sex divisions, perhaps the most interesting example of their perfectly symmetrical arrangement. Special arrangements are, of course, to

be found in famous curative thermal establishments, such as those at Baïæ. The most monumental ruins of Roman baths are those of Caracalla and of Diocletian. The tepidarium of the latter was transformed by Michelangelo into the church of Santa Maria degli Angeli. It was an immense hall 300 feet long and 92 feet wide, covered with a groin vault in three compartments. The halls of Caracalla's thermæ, though not so large—the tepidarium being 170 × 82 feet—were better proportioned and more artistic in decoration. These thermæ had a profusion of marble columns, surface decoration of rich marble slabs, coffered ceilings, rich cornices, mosaic floors, a wealth of decorative statuary and paintings.

The process of bathing was usually as follows: After undressing in the apodyterium, the bather was anointed in the *clæothesium* with oil and then proceeded to a spacious court devoted to exercises of various kinds, among which games at ball held a prominent place. After exercise he went through the tepidarium into the *calidarium* to sweat and take a hot bath; he then returned to the *frigidarium*, took a cold bath, and returned to the *calidarium* or *laconicum* for another sweat. He was then rubbed and anointed by the attendants and resumed his clothing. Sometimes the bather went at once to the hot room and followed the sweat with a cold plunge and a rubbing and anointing.

The public baths for women were much frequented, even by the most respectable. The women bathed in company, like the men. When there were no separate baths for women, they seem to have had the exclusive use of the public baths at special hours. At Rome the great baths were for men only, but were frequented by dissolute women. The irregularity of men and women bathing together is also alluded to by ancient writers, several emperors legislated against it. In later times the baths in general became the scenes of all sorts of debauchery, as was the case at Baia. Consult Lanciani, *Ancient Rome in the Light of Recent Discoveries* (New York, 1888).

The Orient. The barbarian invasions and wars finally put an end to Roman culture in the West in the sixth century A.D., and with its fall the sumptuous baths were abandoned. There were still baths on a small scale in connection with churches and monasteries, and the sacrament of baptism preserved the religious symbolism of the bath. The habits of monasticism and of asceticism combined, however, with northern rudeness in discouraging the luxurious aspects of bathing. It was not so in the East, for the Byzantine Empire continued in this as in most respects the traditions of Rome; and life in Constantinople, in the time of Justinian and Theodora and their successors, was no less pleasure loving than it had been in Rome. The Byzantines preserved there, for eight centuries more, all the various processes of Roman bathing, and initiated into them the conquering Arabs when, after founding the caliphate of Bagdad and the great kingdoms of Egypt and Spain, the Mohammedans adopted all the traditions of advanced civilization around them. From the eighth century to the present day all the Mohammedan cities of the East have been provided with public and private baths on a large scale. The baths at Broussa, for example, show how the main divisions of the Roman bath—*frigidarium*, *tepidarium*, and *cali-*

darium—had been handed down unimpaired. A typical city, Adrianople, had some years ago 22 public baths. The private houses at Cairo, Damascus, and other cities show how common it has been for the wealthy Orientals to have baths. The peculiarities of the Russian bath were also inherited through the Byzantines. The reason for this was both religious and sanitary.

Turkish Baths. Islam enjoins on the believer the careful preservation of corporal purity and for this purpose prescribes repeated daily ablutions. Besides these, certain circumstances and times make the use of the bath ritually obligatory on both men and women. For this end not only did the rich erect splendid baths in their houses and gardens, but bath houses for the people in general were established in every town in which there was a mosque. The public baths of the Turks of the present day are a copy of those ancient Arabian baths. The construction of those Oriental baths, imitations of which are now to be found in most cities, is as follows: The building is of stone; the bathrooms have a floor of marble, which is heated from below, and tubes in the walls conduct the heat in all directions. The bather undresses, wraps himself in a sheet, puts on wooden slippers, to protect him from the heat of the floor, and enters the bathroom. Here a general perspiration soon breaks through the skin, which is washed off with cold water. The body is then rubbed with woolen cloths and smeared with a soap or salve beneficial to the skin. This is generally accompanied by the operation of "kneading." The bath attendant stretches the bather on a table, pours warm water over him, and manipulates and scrubs his whole body. He then dries the body with a haircloth, rubs off the hard skin of the feet with pumice stone, anoints the bather with soap and perfumes, and finishes by cutting his hair and beard. This treatment lasts some three-quarters of an hour. After bathing, the bathers repose in a cooler room, stretched on couches, and finally partake of coffee, sherbet, or lemonade.

Europe. In England, France, and Germany, public establishments for bathing were long unknown. It was during the Crusades, which brought the East and the West into contact, that Europeans first became acquainted with the baths of the Asiatics; and the want of such institutions came to be more sensibly felt from the leprosy and other skin diseases which intercourse with Asia introduced into western Europe. The evil was at first sought to be met by establishing hospitals, but as these were found insufficient, baths and bathrooms were erected, which gradually became public establishments. Still, very little has been done to bring back the antique millennium until this century. It was not until the eighteenth century that the custom of sea bathing and mineral-water bathing began in England, followed by Germany at the close of the century, and by Italy and France early in the nineteenth century. (See BATH HOUSES, MUNICIPAL.)

Russia. Besides the kinds of baths already described, there are now to be found in the larger cities of Europe and America, generally in connection with water baths, an improvement upon the vapor baths which have been long in common use in Russia. The Russian bath consists of a small apartment built of wood, with broad benches running round it, on which the people lie undressed. By throwing water upon

glowing hot pebbles a dense hot steam is produced which envelops the bathers and throws them into such a heat that the perspiration breaks out over the whole body. In this atmosphere of steam the thermometer often rises to 112°-140° F. After they have sweated for some time, and from time to time cooled themselves again, by having cold water poured over them, the skin is rubbed with soap and with towels made of inner bark or with brushes; they are flogged with softened birch twigs and then washed with tepid and afterward with cold water, and at last have cold water dashed over them. A bather will also go direct from the sweating bath and plunge into a river or a pond or roll himself in the snow. These baths are a necessity in Russia and are to be found in every village. The German vapor bath differs in this, that the steam is produced in a boiler, and that the bather remains for some time in an adjoining room of moderate temperature, wrapped in blankets, to allow the perspiration to go on and the blood to become calm. A ruder kind of sweating bath, in a hole in the earth or in a baking oven, is practiced among many nations—among the Finns, the natives of Mexico and South America, and others.

Therapeutic Baths. As regards detergence, the *vapor bath* is the only kind of bath that is really effectual. If the skin is exposed to the action of hot water vapor, the scurf becomes softened and loosened, and is more easy to remove by simple rubbing. In the vapor bath, as in the Turkish bath, in which dry heat is used, the person is cooled by having tepid or cold water dashed upon him. The vapor bath is useful in certain diseases of the skin and kidneys as well as in chronic rheumatism. Its temperature is usually over 99° F. The *continuous bath*, in which the patient remains partly or wholly submerged in warm water for extended periods of time, was first introduced into this country by Dr. A. Rose of New York in 1873. Erysipelas and cerebro-spinal meningitis were treated in this way with marked success. Later the continuous warm bath was introduced by Dr. E. C. Dent into insane asylums, where it was found to calm maniacal patients and induce sleep, replacing sedative drugs and the crude methods of forcible restraint. The continuous bath is used in several foreign health resorts, notably in Leuk in the Alps and in Kewanaka in Japan. Here patients remain in the water for days or weeks at a stretch. Prolonged immersion in warm water stimulates metabolism and increases the elimination of waste products from the body.

The cold sponge bath is useful as a daily tonic to most people. It is a stimulant to nutrition, circulation, and nerve action. It should be brief and followed by brisk friction with the towel. By exhausted, and generally by aged, as well as by thin, nervous, and sensitive persons, cold baths should be avoided, and tepid ones taken instead. A bath in the sea is productive of good in most cases in persons of good physique. Wrapping a patient in a wet sheet and then covering with a blanket (the "wet pack") is sometimes substituted for the cold bath. The hot bath is stimulant, relieving pain and limiting inflammation, controlling convulsions, and inducing sleep. It is useful also in some diseases by causing sweating. At sanitariums and bathing establishments, salt-rubs, electro-chemical, electro-thermal, and other baths are given.

The *Roman bath* consists of an application of oil or vaseline, with massage.

A *medicated bath* is one in which some substance intended to act as a medicine has been mixed with the liquid. This is an ancient and almost obsolete method of bringing remedies to bear upon the system. The mineral substances used were common salt, chloride of lime, nitric acid, corrosive sublimate, the hydroxides and carbonates of sodium and potassium, ashes, soap, iodine, sulphur, iron, etc.; the vegetable were wine, vinegar, solutions of essential oils, infusions of thyme, rosemary, lavender, wormwood, willow, oak, Peruvian bark, etc. *Mercurial baths* are used in syphilis. They are baths in which vapor of mercury is applied to the whole surface excepting the head. The application must be made in a fumigating box, in which the body alone is inclosed along with the vapor, in order that the respiratory organs may not be incommoded. *Animal baths*, used by the ancients, enjoyed a great reputation in cases of lameness. Either the whole or part of the body of the patient was wrapped in the skin of a newly slaughtered animal. Sometimes smaller animals were killed, split up, and immediately applied to the diseased part. Of *gas baths*, the most generally used are those of sulphureted hydrogen and carbonic acid gas, which are to be had at certain mineral springs. In recent times, at Ischl and other places, the vapors that arise from the mineral springs loaded with saline particles are received in close rooms, in which the patients walk about and allow the vapors to act upon the lungs and skin. Consult A. Rose, *Carbonic Acid in Medicine* (New York, 1905). See BATH HOUSES, MUNICIPAL; HYDROTHERAPY.

Te terms *water bath* and *sand bath* have been adopted in chemistry to signify a contrivance by which vessels are heated without being brought into immediate contact with the flame, but receive their heat through the medium of hot water or sand.

BATH, bath (Celt. *Caer-badon*, city of baths, AS. *Bathan*, *Bathum*, short for *æt tham hātum bathum*, at the hot baths; the Roman *Aquæ Solis*, baths of the sun). The chief city of Somersetshire, England, beautifully situated in a wooded valley, inclosed on the north and east by a high range of hills, on the Avon (which is here crossed by four bridges), 20 miles from its mouth, and 108 miles west by south of London (Map: England, D 5). The houses are built of white freestone—"Bath Oolite"—worked in the neighboring quarries. The city has a finer appearance than any other in England, the variety of levels giving commanding sites for its fine and regular streets, crescents, and public buildings. The beauty and sheltered character of its situation, the mildness of its climate, and especially the curative efficacy of its hot chalybeate springs, have long rendered Bath a favorite fashionable resort. The springs, which are four in number, were known to the Romans, who built baths on the spot in the first century, of which extensive remains were discovered in 1775. The temperature of the springs varies from 116° to 120° F.; they rise near the river bank, in the centre of the city, and discharge more than half a million gallons of water daily. The water is most useful in bilious, nervous, and scrofulous complaints, palsy, rheumatism, gout, and cutaneous diseases. Bath has many handsome public buildings, among them being the pump room which incloses some of the springs

and which has been improved in recent years; the guild hall, containing in addition to the municipal offices, technical schools, an art gallery and reference library; and the Royal Literary and Scientific Institution, containing several fine scientific collections and a library. The abbey church of St. Peter and St. Paul is a cruciform building in the perpendicular style, dating from the sixteenth century. It has a tower 162 feet high and on account of the number and size of its windows has been called the "Lantern of England." Among many other churches those of St. Swithin's and St. Thomas of Canterbury are the most interesting. There are several fine parks, including the Victoria Park of about 50 acres, containing a botanical garden and an excellent theatre. The city is well lighted by electricity, which the corporation supplies. It also maintains a museum, public baths, and markets. Bath is amply supplied with educational facilities. In addition to the technical school maintained by the corporation there is a grammar school founded by Edward VI, at which De Quincey was educated, Lansdown Royal School, for Officers' daughters, and Wesleyan College. Its charitable institutions include numerous hospitals and an eye and ear infirmary. Its three railway lines, and the Kennet and Avon Canal connecting the city with the Thames River, furnish excellent means of communication. It is a parliamentary borough and sends two members to Parliament. Bath was a royal residence in Anglo-Saxon times. Richard I and Edward III granted it many privileges. In the eighteenth century Richard Nash (q.v.) made it the most fashionable resort in England. Pop., 1901, 49,800; 1911, 50,729. Consult: "Municipal Roman Baths at Bath," in *Municipal Journal*, vol. viii (London, 1899); Bath Committee, *Handbook to Bath* (Bath, 1900); Perkins, *The Abbey Churches of Bath, Malmesbury* (London, 1901); Barbeau, *Une ville d'eaux anglaise au XVIII^e siècle* (Paris, 1904); Green, *Eighteenth Century Architecture of Bath* (Bath, 1904).

BATH. A city, port of entry, and the county-seat of Sagadahoc Co., Me., on the Kennebec River, 12 miles from the sea, and 36 miles north-east of Portland (Map: Maine, C 5). It is on the Maine Central Railroad and has steamboat connections with Boston, Augusta, and Boothbay Harbor. Ship building is the main industry, and several vessels for the United States navy have been built here. There are also brass and iron foundries, machine shops, boiler works, and manufactures of lumber, manganese bronze, gasoline engines, steam windlasses, shirts, etc. Bath contains a public library, a hospital, a soldiers' and sailors' orphans' home, and two homes for aged persons. The charter was adopted in 1847 and the city ordinances revised in 1899. The charter limits the mayor's term to one year and provides for a bicameral city council. The majority of administrative officers are elected by the city council, though the mayor exercises some appointive power, subject to the consent of the board of aldermen. The superintendent of schools is chosen by the school committee, which is elected by the people. Pop., 1890, 8723; 1900, 10,477; 1910, 9396.

The first settler within the present limits of Bath was probably Robert Gutch, a missionary to the Indians, about 1660. In 1781 the settlement was incorporated as the town of Bath, and in 1847 a city charter was obtained. Consult

Reed, *History of Bath and Environs* (Portland, 1894).

BATH. A village and the county-seat of Steuben Co., N. Y., 75 miles south-southeast of Rochester, on the Erie, the Lackawanna, and other railroads, and on Cohocton River (Map: New York, C 6). It contains the Davenport Public Library, Davenport Orphan Asylum, the New York State Soldiers' and Sailors' Home, three parks, a soldiers' monument, and the various county buildings. The principal industries are agriculture, lumbering, wine storage, and the manufacture of aeroplanes, automobile engines, sashes and blinds, harness, tables, motor cycles, etc. Settled as early as 1793, Bath was first incorporated in 1816. The government, under a charter of 1895, is vested in a mayor, annually elected, and a village council. Pop. (exclusive of inmates in Soldiers' and Sailors' Home), 1900, 4994; 1910, 3884.

BATH, bath, EARL OF. See PULTENEY, WILLIAM.

BATH, ORDER OF THE. The name of the largest English order, and the highest to which a commoner can attain. Its name was evidently derived from the initiatory ceremony of bathing, which used to be practiced at the installation of a knight, as an emblem of the purity henceforth required of him by the laws of chivalry. It is asserted by Froissart that in 1127 Henry I made Geoffrey of Anjou and five others "Knights of the Bath," and Burke relates that Lord Wiltoughby received "knighthood by bathing" from Edward II. The last creation of Knights of the Bath in the ancient form was at the coronation of Charles II in 1661. From that period till the accession of the House of Hanover, the order fell into oblivion. It was revived by George I in 1725 and is now the second order in rank in England, the first being the Garter. The order was military till 1847, when it was reorganized by the admission of civil Knights, Grand Cross, Commanders and Companions. As constituted at present, the order comprises three classes—Knights Grand Cross (G.C.B.), Knights Commanders (K.C.B.), and Companions (C.B.), the two former including also honorary members. For illustration, see Plate II of ORDERS.

BATH BRICK. See BRICK; ABRASIVES; BRISTOL BRICK.

BATHGATE, bath'gät. A town in the centre of Linlithgowshire, Scotland, 17 miles west-southwest of Edinburgh (Map: Scotland, E 4). The old town lies on a steep slope, and the new on a more level site. The celebrated gas-coal called Torbanehill mineral is worked here, and the district is rich in minerals. Bathgate manufactures paraffin, flour, glass, and paper, but mining is the chief occupation of the inhabitants. Pop., 1871, 6942; 1901, 6786; 1911, 8226. In 1668 King Charles II granted Bathgate a charter, from which time it was a free burg of barony until it was incorporated as a police burg in 1865. In the vicinity is the site of an ancient castle, which Margaret, daughter of Robert Bruce, brought as a part of her dowry to her husband, Walter, great steward of Scotland, who died here.

BATH HOUSES, MUNICIPAL. Liverpool was the first modern European city to construct inclosed bath houses with appliances for furnishing both hot and cold water. This was in 1842. In 1846 Parliament passed an act to encourage the establishment of public baths and wash-houses, and since that time the movement in

favor of public baths has rapidly spread in Great Britain, until now every borough with a population of over 50,000 has municipally owned bath houses, and very many smaller cities are well supplied with such facilities. The cities of continental Europe do not possess so many public baths. The Public Health Exhibition of 1883 in Berlin, Germany, aroused public sentiment to the need of cheap baths for the people, and in 1900 Germany had municipal bath houses in 45 of its cities having a population of over 50,000. France has fewer, and in Austria, Norway, and Sweden baths have been erected in only the larger cities. In Vienna the first people's bath was built in 1887. At the close of the century the city operated 11 such establishments. In Russia people's baths are very common, even in the smaller villages, but these are not owned by the municipality and are often most unsanitary. The city of Tokio, Japan, is said to have 1000 public bath houses.

The movement in favor of municipal baths scarcely began in America until the close of the nineteenth century. The need of municipal baths in the larger cities was pointed out in the Report of the Federal Bureau of Labor in 1893, which showed, among other things, that in certain selected districts bathroom facilities were possessed by only 2.83 per cent of the population in Chicago and New York. At this time there were no all-the-year municipal baths in operation in the United States. Ten years later a list of 39 such baths was published in the report of the bureau, besides 59 beach or floating baths open in summer. In Statistics for the Cities for 1907, 32 cities report baths and bathing places valued at \$1,541,733, of which 78 were all-the-year baths. The total bathing attendance was 29,204,838. In 1874 Massachusetts enacted a law permitting the public funds to be used for the erection of public baths and washhouses. But New York was the first American State to enact legislation making the erection of public baths compulsory. In 1895 a law was passed that all cities having a population of more than 50,000 should establish and maintain such free public baths as the local board of health might deem to be necessary, and that any city or village having less than 50,000 inhabitants might loan on its credit or appropriate of its funds for this purpose. The baths must be open 14 hours a day, and both hot and cold water must be provided. The maintenance of river, lake, or ocean-front baths is not to be considered a compliance with this act. The first bath house erected under the act was opened in Buffalo in 1897.

Of public baths there are four general types—beach baths, floating baths, pool baths, and shower baths. One of the best and most popular of the beach baths, as also the oldest, is the one which was constructed in 1866 on the L Street Beach, South Boston.

A floating bath usually consists of a platform placed upon floats, in the centre of which is a pool surrounded by dressing rooms. The pool is constructed of slats in such a manner that the water has free circulation through its sides and bottom. The floating bath may be moored at any convenient point along the water front and is especially suited for smaller cities located upon bodies of clean water. In large cities the increasing pollution of the water renders a suitable location for floating baths more and more difficult to find.

Pool baths were first built in 1885, in Philadelphia, as a substitute for floating baths, which the city was compelled to give up on account of the polluted water. Subsequently pool baths were built in Chicago, Holyoke, Boston, Newark, Utica, and Kansas City. Such a bath consists simply of a pool or tank surrounded by dressing rooms, and may or may not be roofed in.

The shower bath is entirely different, in both form and object, from the three types of baths already described. The former are open during the summer months only and are chiefly useful as places of wholesome exercise and recreation. But the shower bath is open throughout the year and furnishes hot as well as cold water, and its only object is cleanliness. The typical shower consists of an overhead douche or ring in which the water supply is controlled by a valve so arranged that the cold water comes out first and the temperature of the supply is controlled by the user. The floor under this spray is inclined so that the water rapidly runs off into a drain. Each bather is provided with a separate dressing room, opening into the bathroom. Shower baths are rapidly displacing the old-time tub or "slipper" baths in both Europe and America. Their advantages are obvious: they require less room, less water, and less attendance, and are therefore cheaper; they are also more easily kept in a sanitary condition, and the shower is a more healthful form of bath than the tub. The city of Baltimore late in 1908 made an interesting experiment in a so-called "portable bath house." This was located in a tent with a temporary connection with the city mains and was equipped with shower baths. So successful was the experiment that three such baths were operated in 1911. They are especially useful where large groups of people are temporarily collected, as at camps or where extensive work is going on.

A recent extension of free baths is their introduction into the public schools. This movement, like that for municipal baths in general, began in Germany, being established by Professor Flugge and Mayer Merkel in the schools of the German university town of Göttingen in 1885. Boston has introduced the institution into this country by constructing a number of public baths in the Paul Revere School, in the north end of the town, in 1900, and other cities are following its example.

Consult *Bulletin No. 54* of the United States Bureau of Labor (Washington, 1904); Reports of Free Public Bath Commission, Baltimore; William Paul Gerhard, *Modern Baths and Bath Houses* (New York, 1908); Alfred W. Cross, *Public Baths and Washhouses* (London, 1906).

BATH-KOL' (Heb. daughter of the voice, from *bath*, daughter + *kol*, voice). An expression which signifies simply a sound and which is also used to designate an echo. Its specific application, however, in rabbinical theology is to a manifestation of the divine will by means of a voice distinctly heard and announcing an order on the decision of some disputed point. It corresponds therefore to an oracle, only that the source of the voice is regarded as hidden. This usage of the term reverts ultimately to such a phrase as is found in Daniel (iv. 31): "A voice fell from heaven." Similarly in the New Testament, heavenly voices are referred to at the baptism of Jesus (Matt. iii. 17; Mark i. 11), at His transfiguration (Matt. xvii. 5; Mark ix. 7; Luke ix. 35), before the Passion (John

xii. 28), and in the same way Paul and Peter hear voices from heaven. According to the views expressed in the Talmud, Bath-Kols were sent to Israel from time to time throughout its history, and numerous examples are instanced, and in theory such "voices" were regarded as decisive factors after the extinction of divine prophecy in Israel. So it is reported that, as late as the days of Hillel and Shammai, the differences between these two schools of interpretation of the Jewish law were decided by a Bath-Kol in favor of Hillel (Berachoth 3b). In general, however, the tendency developed not to be guided by supposed "voices," and so Bath-Kol came to be practically a term indicating the decision of a disputed question by rabbis whose authority was recognized. Consult: F. Weber, *Jüdische Theologie* (2d ed., Leipzig, 1897); Hamburger, *Real-Encyclopädie für Bibel und Talmud*, ii. s. h. v. (Strelitz, 1883); Bacher, *Die Agada der Tannaiten* (2d ed., 1903); Louis, "Ancient Traditions of Supernatural Voices: Bath-Kol," in *Transactions of the Society of Biblical Archaeology*, vol. ix, p. 18.

BATH'OLITH, BATHYLITE, BATHYLITH (Gk. *βάθος*, *bathos*, depth, or *βάθης*, *bathys*, deep + *λίθος*, *lithos*, stone). A great, poorly defined mass of plutonic rock that affords evidence of having been formed far within the depths of the earth's crust during early periods of geological time, and of having attained its present condition of exposure at the surface through the agency of erosion. Such masses are common among rocks of the Archæan or pre-Cambrian age, and often measure miles in extent. Evidence of the deep origin of batholiths is furnished by the coarsely crystalline texture of the constituent rocks—a structure produced only by slow cooling and solidification at great depths in the crust. This hypothesis is also confirmed by the fact that such batholiths appear to have been fused from below upward and to have incorporated within their mass portions of the overlying and surrounding rocks. See IGNEOUS ROCKS; PRE-CAMBRIAN FORMATIONS.

BATHOM'ETER (Gk. *βάθος*, *bathos*, depth + *μέτρον*, *metron*, measure). An instrument invented by C. Williams Siemens, for indicating the depth of the sea beneath a moving vessel. The density of sea water is about 1.026, while that of solid earth or rock has an average of about 2.75. Hence the attraction of the water which lies beneath the ship is less than that which would be exerted by earth or rock occupying the same relative position, and the greater the depth of water, the less the attraction. The weight of a given mass on board the ship will be greater, therefore, when the ship is in a harbor or in shallow water than when on the deep sea by an amount which may be determined by an instrument of sufficient delicacy, and this change in weight becomes a recognizable function of the depth of water. Dr. Siemens filled with mercury a vertical steel tube of small bore, fitted below with a cup-shaped expansion closed with a corrugated steel-plate diaphragm. The pressure of the mercury upon the upper surface of the diaphragm is opposed by a plate adjusted to bear upon the centre of its upper surface, and this plate is supported by steel spiral springs, which are attached to the top of the column. In the construction of the instrument care was taken to compensate for the variations caused in the density of the mercury and in the elasticity of the steel springs by change of tem-

perature. The pressure of the mercury in the diaphragm causes an extension of the steel springs by an amount depending on the force of attraction acting on the mass of the mercury. This extension of the spring is so magnified by a micrometer screw that the apparatus indicates a change of a fathom in depth of water for each division on the scale of the micrometer.

BÁTHORY, bá'tó-ré. A noble family of Hungary. STEPHEN BÁTHORY (1533-86), was elected Prince of Transylvania in 1571 and King of Poland in 1575. He married Anna, sister of the last of the Jagellons of Poland. He introduced reforms in the administration of Poland and waged war successfully against Russia. His right hand in the government of Poland was the distinguished statesman, Zamojski.—His brother, CHRISTOPHER, was Prince of Transylvania from 1576 to 1581. He was a friend of the Jesuits, by whom his son and successor, SIGISMUND BÁTHORY (1572-1613), was instructed. The latter in 1595 married a daughter of the Archduke Charles of Styria, an uncle of Rudolph II. In 1598 he transferred the principality of Transylvania to Rudolph, as he intended to enter the priesthood. He soon regretted his renunciation of the territory, however, and while the Imperial commissioners were still negotiating the terms of acceptance, suddenly appeared disguised at Klausenburg and arrested them, sending Bocskay to Prague to pacify the Emperor. He was compelled to resign in 1602.—GABRIEL BÁTHORY (1589-1613), a son of Stephen, King of Poland, was elected Prince of Transylvania in 1608. In consequence of his cruelty the magnates of his realm, as well as the Saxon element of the country, rose against him, and during the war which ensued he fled to Grosswardein, where he was murdered.—ELIZABETH BÁTHORY, niece of Stephen Báthory, King of Poland, is celebrated as a type of fiendish cruelty. She is said to have slaughtered 650 young girls, in whose blood she used to bathe, to increase the fairness of her skin. She died in prison in 1614.

BÁTHOS (Gk. *βάθος*, depth). A term employed by critics to designate a ludicrous descent from a lofty thought to a mean one, or a sinking below the ordinary level of thought in a ridiculous effort to aspire. (See ANTI-CLIMAX.) A good example of bathos is the well-known couplet:

"And thou, Dalhousie, the great god of war,
Lieutenant-colonel to the Earl of Mar."

Consult Pope, "The Art of Sinking in Poetry," in the *Scribner's Papers* (London, 1729).

BATHSHEBA, báth-she'ba or báth'shé-bà (Heb. *bath*, daughter + *sheba*, oath; daughter of an oath). 1. The wife of Uriah, and afterward mother of Solomon. 2. The name under which Charles II's mistress, the Duchess of Portsmouth, appears in *Abalom* and *Achitophel*, a satire by Dryden. 3. The heroine of Thomas Hardy's *Far from the Madding Crowd*.

BATHS OF TITUS. See TITUS, BATHS OF.
BATH (báth) **STONE**. A building stone extensively used in England on account of its beauty and obtained from quarries in the Lower Oolite of Wiltshire and Somersetshire. It is fine-grained, of a rich cream color, and is composed of carbonate of lime, with a little carbonate of magnesia, but without silica. The name is derived from the city of Bath, in the vicinity of which the stone is largely quarried.

BATHURST, bath'urst. A city and a county of New South Wales, Australia, 145 miles west of Sydney (Map: New South Wales, E 3). The city was founded in 1819 and was the first settlement beyond the Blue Mountains (q.v.), which were long believed to be impassable. In 1851 there were discoveries of gold here, and this, with copper and silver, is the chief mineral product. Fine statuary marble is quarried. The county is bounded on the northeast by the Macquarie River and on the southeast by the Lachlan. The whole district is admirably adapted to pastoral pursuits, and about a quarter of a million acres are under cultivation. Corn, barley, wheat, fruit, and tobacco are the chief products. It is well watered and, being 2150 feet above sea level, has a moderate temperature. Bathurst, the principal city in the western district of New South Wales, has handsome public buildings and various important industries. It was created a municipality in 1862. It is the see of Anglican and Roman Catholic bishops, has science and art schools, a museum, and a government agricultural experiment station. Pop., 1901, 9578; 1911, 8575.

BATHURST. The principal settlement of the British colony of the Gambia, West Africa, situated on the island of St. Mary at the mouth of the Gambia, in about lat. 13° 24' N. and long. 16° 36' W. (Map: Africa, C 3). The town is exceptionally clean and contains government houses, barracks, and a hospital. Facing the river are the stores of the European merchants. The exports consist of gum, wax, hides, rice, tobacco, cotton, ground-nuts, rubber, and fruit. Medicinal roots and herbs and vegetables of all kinds are grown. There are a number of expert shipbuilders in Bathurst. The population in 1911 numbered about 5000. This included the Jollofs, which tribe inhabits the district in the vicinity of the town.

BATHURST. A port of entry on Nepisiguit Bay, at the mouth of a river of the same name, in Gloucester Co., New Brunswick, Canada (Map: New Brunswick, D 1). It is 211 miles north by east of St. John, is on the Intercolonial Railway, and is a popular summer resort. Bathurst has a good harbor, and its principal industries are connected with lumbering and fishing. The rivers emptying into the harbor are noted for fine salmon. The town is the seat of a United States consular agent. Pop., 1901, 1044; 1911, 960.

BATHURST, ALLEN, first EARL OF BATHURST (1684-1775). An English statesman, born in London. He entered Parliament in 1705 and distinguished himself as a supporter of the union of England and Scotland. In 1711 Queen Anne made him a baron, and he won further distinction in the Upper House by impeaching the directors of the notorious South Sea scheme. Bathurst was a determined opponent of Walpole and on that minister's resignation in 1742 was made a member of the Privy Council. In 1757 he became treasurer to the Prince of Wales, who, as George III, elevated him to an earldom in 1772. He was a generous patron of literature, and the friend of Congreve, Vanburgh, Swift, Prior, Rowe, Addison, Pope, Arbuthnot, Gay, and others. Pope dedicated his *Epistles on the Use of Riches* to Lord Bathurst and complimented him in characteristic lines. His son Henry, second Earl Bathurst (1714-94), was Lord Chancellor of England, 1771-78. Henry, third Earl Bathurst (1762-1834), son of the second Earl,

was English Colonial Secretary, 1812-27, and Lord President of the Council, 1828-30.

BATHURST, RALPH (1620-1704). The uncle of the first Lord Bathurst, an English physician, prelate, and wit. He rose to eminence in medicine and in the time of the Commonwealth was appointed physician to the state. After the Restoration he abandoned medicine, took holy orders, was chaplain to the King, and afterward Dean of Wells. In 1664 he was made president of Trinity College, Oxford, and in 1691 was nominated to the see of Bristol, but declined the place. He was master of ridicule and, like Dr. Jowett in recent times, made that his weapon to correct college delinquents. Some of his verses in the *Musa Anglicana* are excellent of their kind. Consult Warton, *Life and Literary Remains of Bathurst* (London, 1761).

BATHURST INLET. An indentation of Coronation Gulf, in the Arctic Ocean, which projects 75 miles south into Canada, 300 miles northeast of Great Slave Lake (Map: Northwest Territories, H 1). The explorer Harry V. Radford wrote from this place, on June 5, 1912, that he had nearly completed his survey of the unexplored coast of the inlet. He and his comrade were killed a few days later.

BATHURST ISLAND. An island off North Australia, about lat. 12° S. and long. 130° E., 2°, 120 miles west of Port Essington, with Melville Island between (Map: Australasia, E and F 4). Its length and greatest breadth are 30 miles. The island is mountainous and densely wooded, except at the west end.

BATHURST ISLAND. A large island in the Parry Archipelago north of North America, intersected by the 100th meridian of west longitude and situated immediately beyond the 75th parallel (Map: America, North, H 2). Sherard Osborn here found the vertebrae of an ichthyosaurus—one of the few instances of organic remains discovered in the polar basin on the American side.

BATHYANI, bō'tyā-nē. See BATHYÁNYI.

BATHYCLES, bāth'ī-klēz (Gk. Βαθυκλῆς). A Greek sculptor, born at Magnesia about 600 B.C. He has become celebrated through a colossal throne which he executed for the Spartans. This throne was decorated with reliefs which have been described by Pausanias. It was carved for the sanctuary of Apollo at Amyclæ and inclosed the rude statue of the god.

BATIGNOLLES, bā'tā'nyōl'. A former commune in the department of the Seine, France, now a part of Paris, forming with Ternes the seventeenth arrondissement. It is the Parisian equivalent for the Whitechapel of London and the East Side district of New York.

BATISTE, bā-tēst'. A fine linen or cotton lawn originally made in France, and said to have been named from its inventor, one Jean Baptiste. See CAMBRIC.

BATJAN, bāt-yān'. One of the Moluccas, lying west of Gilolo and east of Celebes. Batjan has a total area of 914 square miles (with adjacent isles, 1020 square miles), and a population estimated at 12,000 to 13,000, of which a few hundred are Chinese, Arabs, and Europeans, and the rest mostly Alfuros. The soil is fertile, and the main industry is the cultivation of spices, as on most of the Moluccas. It belongs to the Dutch, but is governed by a native sultan. There are several settlements, and on the western coast is situated Fort Barneveld.

BATLAPI, bāt-lā'pē. A Bechuana tribe of

the Bantu family, living between Taungs and Vryburg; formerly a powerful tribe, now weakened by wars with the Boers and Matabeles. Though still the most numerous of the Bechuana group, they are under British control.

BATLEY. A town in the West Riding of Yorkshire, England, 8 miles southwest of Leeds, and about 1 mile from Dewsbury, with which it unites in sending one member to Parliament. The town was incorporated in 1868, and owns its gas and water works. It also maintains public baths, markets, a library, and a cemetery. There are an ancient grammar school, and a technical school supported by public subscription, with a municipal appropriation. Batley is the centre of the heavy woolen trade and manufactures army cloth, shoddy, drugget, etc. Coal is mined, there are stone quarries, and manufactures of iron and machinery. Pop., 1891, 28,800; 1901, 30,300; 1911, 31,429.

BATNA, bāt'nā. The chief town of an arrondissement, department of Constantine, Algeria, 62 miles south-southwest of Constantine. It is situated at the foot of Mount Tugurt, which is covered with fine cedar wood. The town contains a church and a mosque and is an important military post and trading station between the Sahara and Tell. Pop., 1896, 8381; 1901, 6914; 1911, 8890.

BATN-EL-HAJAR, bāt'n-el-hā'jār (Ar. womb of rocks). A stony district of Nubia, along the Nile, in lat. 21° N., where the river forms its second cataract.

BATON, or **BEND SIN'ISTER**. See **HERALDRY**.

BATONI, bā-tō'nē, or **BATTONI**, **POMPEO GIROLAMO** (1708-87). An Italian painter. He was born at Lucca and worked first with his father, a goldsmith. His artistic education consisted chiefly in the independent study of Raphael and of the monuments of classic antiquity at Rome, where he passed most of his life. He was the friend and associate of Raphael Mengs and Winckelmann, but was less classical than the former in his art, retaining the charm of the Rococo, particularly in his color. He was the most celebrated painter of his day, and his works were sought after throughout Europe. Among the most important of these are the portraits of the popes Benedict XIV, Clement XIII, and Pius VI, and of the Emperor Joseph II and Leopold II, Grand Duke of Tuscany; "Marriage of St. Catharine" (Quirinal, Rome); "Achilles" (Uffizi, Florence); "Choice of Hercules" (Turin Gallery); "Madonna" (Louvre, Paris); "Magdalen," his best-known painting; "John the Baptist" and "The Fine Arts" (Dresden Gallery); "Marriage of Cupid and Psyche" (Berlin Museum). Consult O. Boni, *Elogio del cavaliere Pompeo Batoni* (Rome, 1787).

BATON ROUGE, bāt'on rōōzh (Fr. red baton or stick). The capital of Louisiana, 79 miles by rail northwest of New Orleans, on the eastern bank of the Mississippi River, on the Louisiana Railway and Navigation Company line, and on the New Orleans, Texas, and Mexico, Morgan's Louisiana and Texas, and the Yazoo and Mississippi Valley railroads (Map: Louisiana, D 3). It is a picturesque city, built on the river bluff, and contains the State University, organized in 1860, State educational institutions for the deaf, dumb, and blind, orphan asylums, State penitentiary, and State agricultural experiment station. Other features of interest are the State Capitol, Hill Me-

morial Library, Elks' Home, city hall, post office, high school buildings, several monuments, and a national cemetery. Baton Rouge is a port of entry and, on account of its fine harbor, carries on a large shipping trade. It also has extensive manufacturing interests, including the largest southern refinery of the Standard Oil Company, oar, box, and brick factories, sugar refineries, artificial ice plant, and cottonseed oil and lumber mills. The city adopted the commission form of government in 1913. Pop., 1900, 11,269; 1910, 14,897.

Baton Rouge was one of the earliest French settlements in Louisiana. At the beginning of the Revolution it was strongly garrisoned by the English, but in September, 1779, was taken by a large Spanish force under Governor Galvez. The city became the capital of the State in 1849, and on Jan. 26, 1861, the Louisiana ordinance of secession was adopted here. On Aug. 5, 1862, Baton Rouge was the scene of a fierce encounter between a Union force under Gen. Thomas Williams and a strong Confederate detachment under Gen. John C. Breckenridge, the latter being repulsed after two hours of severe fighting, though Williams lost his life.

BATRACHIA, bā-trā'ki-ā (Gk. *βάτραχος*, *batrachos*, frog). A word synonymous with Amphibia (q.v.).

BATRACHOMYOMACHIA, bāt'rā-kō-mi'ō-mā'ki-ā (Gk. *βατραχομυομαχία*, Battle of Frogs and Mice, from *βάτραχος*, *batrachos*, frog + *μῦς*, *mys*, mouse + *μάχη*, *machē*, battle). A Greek mock-heroic poem, erroneously bearing the name of Homer. Plutarch said that its actual author was Pigres of Caria, brother of Queen Artemisia, who joined Xerxes in his invasion of Greece. The poem is a parody on the *Iliad*, in which the military preparations and contests of beasts, single combats, intervention of the gods, and other Homeric circumstances are described with much humor. Chief critical edition by Ludwig (Leipzig, 1896).

BATSHIAN, bāt-shyān'. See **BATJAN**.

BATAKS, bāt'taks, or **BATTAS**, bāt'tāz. The natives of the northern interior of Sumatra. Physically they are somewhat darker, taller, and stronger than the coast Malays and are mesocephalic in head form. One of the most individual of East Indian peoples, they present marked contrasts of culture and seeming savagery. A well-developed village life, agriculture (even including a plow), cattle breeding of a notable sort, metal working (even gold weaving), and the arts of reading and writing, with an alphabet modified from the characters of the Asoka inscriptions (the writing is characteristically on pieces of bamboo, from bottom to top), flourish on the one hand; while on the other there exist debt slavery, permissive polygamy, exocannibalism, and man eating as a punitive institution, together with primitive ancestor and spirit worship, influenced, as the mythological names, etc., indicate, by Hindu sources. The house architecture of the Battaks, solidier than the general Malay type, is a modification of the pile dwelling of a shore people, to suit the highlands, while in parts of the area the primitive tree house still survives. Their palisaded kampongs (villages) and other war devices are of interest. A collection of 60 views of houses, landscapes, natives, etc., from the Battak country was published in 1880 by the Penang Photographic Studio. In 1908 a "Battak Institute" was established at Leyden for the

study of the Battak country, people, etc. (the encouragement of agriculture and the spread of the use of the Dutch language among the Battaks were some of its objects). In 1909 a "Battak Society" was founded at Medan. Much is being done to advance the condition of the natives and their relations with European colonists. Since the account of the Battaks by Junghuhn in 1847 there have been several studies of this interesting Malay people, the chief of which are: Schreiber, *Die Battalander in ihrem Verhältnis zu den Malaien auf Sumatra* (Barmen, 1847); Brenner, *Besuch bei den Kannibalen Sumatras* (Würzburg, 1893); Modigliani, *Fra i Batacchi indipendenti* (Rome, 1892); Hagen, *Beiträge zur Kenntnis der Battareligion* (1882); Wameck, *Die Religion der Batak* (Leipzig, 1909); Volz, *Die Batakländer* (Berlin, 1909).

BATTALION (Fr. *bataillon*; for derivation, see **BATTLE**). **INFANTRY**. A separate body of men with a distinct organization, and generally the unit of command in the organization or manœuvring of an army. Originally the battalion was supposed to comprise the largest number of men, who, when drawn up in battle order, could hear the word of command or trumpet-call. The modern battle formation, and consequent army organization, is a direct result of the improved firearms with which modern infantry is equipped, the principle now underlying the strength of the battalion as a unit of command being generally the largest number of men capable of effective control as a unit in action. Modern expert military opinion, based on the experience of recent wars, would seem to indicate the necessity of still further reducing the strength of the unit of command in "attack" formation, a single company, when extended for "attack," covering over half a mile of ground. This, together with the fact that the present complement of officers is not enough to insure complete control, is a difficulty which increases with the battalion, and correspondingly with the strength of the battalion. It also is reflected in the difficulty of obtaining a rapid ammunition supply along the firing line and renders more arduous the task of the hospital corps and stretcher bearers. The reader is referred to the infantry drill regulations of the various armies.

In the United States regular army there are three battalions to a regiment, each commanded by a major. The following instances show the battalion strength in the armies of the greater European Powers:

England.—Battalion consists of 8 or 10 companies, corresponding in strength to the United States regiment.

France.—Battalion consists of 4 companies; 3 battalions to a regiment.

Germany.—Battalion consists of 544 men, raised in war to 1002, and divided into 4 companies. There are 3 battalions in a regiment.

Russia.—The battalion consists of 4 companies; the regiment of 4 battalions, or 17 companies in all, including the non-combatant company.

Italy.—Four companies to a battalion; 3 battalions to a regiment.

The name "battalion" is also given to engineers and various departmental corps, consisting of two or more companies. See **ARMY ORGANIZATION**; **TACTICS, MILITARY**; **INFANTRY**.

BATTAS. See **BATAKS**.

BATTENBERG, bät'ten-berk (anciently, *Mons priscus Batava gentis*, ancient hill of the

Batavian tribe). A town of Prussia in Hesse-Nassau, on the Eder, 15 miles north-northwest of Marburg. Before 1866 it belonged to Hesse-Cassel. The title of Prince of Battenberg dates from 1858, when it was conferred on the issue of a morganatic marriage of Prince Alexander of Hesse with the Countess von Hauke. Their second son, Prince Alexander, was called to occupy the throne of Bulgaria. (See **ALEXANDER I.**) Pop., 1900, 950.

BATTENBERG, HENRY MAURICE, PRINCE OF (1858–96). Son of Prince Alexander of Hesse by a morganatic marriage with the Countess von Hauke. In 1885 he married Princess Beatrice, youngest daughter of Queen Victoria. He took part in the Ashanti Expedition in 1895 and died of fever. His eldest daughter, Princess Victoria Ena, became the wife of Alfonso XIII of Spain in 1906.

BATTENBERG, LOUIS ALEXANDER, PRINCE OF (1854–). A British prince and admiral, born at Gratz, Austria, and eldest son of Prince Alexander of Hesse. In 1868, having been naturalized as a British subject, he entered the Royal navy as a cadet. Promoted to be lieutenant in 1876, he was made commander in 1885 and captain in 1891. In the Egyptian War of 1882 he served with distinction. In 1884 he married his cousin, Princess Victoria, the daughter of Louis IV, Grand Duke of Hesse, and of Princess Alice, the daughter of Queen Victoria. From 1902 to 1904 he served as director of naval intelligence, and was then made rear-admiral with the command of the Second Cruiser Squadron. He was second in command of the Mediterranean Fleet from 1906 to 1908, commander-in-chief of the Atlantic Fleet from 1908 to 1910, and commander of the third and fourth divisions of the Home Fleet in 1911. He was appointed Second Sea-Lord in 1911, and in December, 1912, succeeded Sir Francis Bridgman as Admiral-of-the-Fleet.

BAT'TERING-RAM (Eng. *batter*, Fr. *batterie*, to strike). An engine of war used in ancient times and in the Middle Ages. It consisted of a beam of wood, with a mass of bronze or iron on one end, resembling the head of a ram (in Lat. *aries*). In its simplest form it was borne and impelled by the hands of the soldiers; afterward it was suspended in a frame and made to swing. Another form moved on rollers. The alternating motion was communicated by ropes. To protect those working it, a wooden roof (*testudo*) was constructed over it, and the whole was mounted on wheels. The beam of the ram varied from 60 to 120 feet in length, the head sometimes weighed above a ton, and as many as 100 men were at times employed in impelling the machine. When the blows were long enough continued, hardly any wall could resist. The besieged tried to drop stones on the *testudo* and on the ram itself, or to render it useless by catching it with grappling irons, or by undermining the *testudo* and the frame from which the ram was swung. When or where it was invented is unknown. It is mentioned by Ezekiel. The Romans received it from the Greeks.

BAT'TERSEA (St. Peter's Isle, from AS. *éj*, island). A metropolitan borough of Greater London (Map: London and Vicinity, E 6).

BAT'TERSEA PARK. A park of 185 acres in the southwestern part of London, on the Thames, laid out in 1852–58. It contains a sub-tropical garden of four acres, artificial lakes, and other attractions.

BAT'TERSON, HERMON GRISWOLD (1827-1903). An American Episcopalian clergyman. He was born at Marbledale, Litchfield Co., Conn., and was educated privately. In 1860 he was ordained to the ministry. He was pastor of St. Mark's Church, at San Antonio, Tex., rector of Grace Church, Wabasha, Minn., of St. Clement's and of the Church of the Annunciation, Philadelphia, and of the Church of the Redeemer, New York. He was the author of several works, all of which have been frequently reprinted, such as the following: *The Missionary Tunc-Book* (1868); *Christmas Carols and Other Verses* (1877); *Sketch-Book of the American Episcopate* (1876); *Pathway of Faith*; *Vesper Bells*.

BATTERY (Fr. *batterie*, from *battre*, Lat. *battere*, to batter, beat). A term pertaining to the artillery arm of the military service. The armament pertaining to land forces may be conveniently divided into two classes: *fixed* and *movable*. The fixed armament consists of guns and mortars of various classes mounted on stationary carriages in groups of two or more of the same calibre and power, these groups being called "batteries." The term "battery" includes not only the work itself, with its slopes, guns, platforms, ammunition hoists, galleries, rooms, passages, and magazines, but also all material used in connection with the service of the pieces, and the *personnel* assigned to the work and its appurtenances. Such a battery in a coast fort is a *seacoast battery*; in any other fort a *fortification battery*; it may also be called a *mortar battery*, if composed of mortars; a *rapid-fire battery*, if composed of rapid-fire guns, etc.

Batteries are sometimes designated according to the purpose for which they are employed or the manner in which they are mounted as: *barbette battery*, if mounted *en barbette*, or so as to fire over a parapet; *blinded battery*, if protected by armored or bomb-proof defenses; *breaching battery*, one designed to make a breach in the enemy's defenses; *cavalier battery*, situated within the bastion (q.v.); *counter battery*, one designed to disable such guns of the defense as interfere with the breaching batteries; *enfilading* (q.v.) *batteries*; *floating battery*; *masked* or *fascine battery*, one concealed by fascines or other artificial device; *redan* (q.v.) *battery*; *sunken battery*; *water battery*, one close to high-water mark.

The movable armament consists of guns, mortars, and howitzers mounted on wheeled carriages on which they are transported and from which they are fired, or of guns carried on the backs of animals. Groups of guns used in an attack on a fortified place, which is being besieged, become *siege batteries*. These are usually composed of the heaviest guns designed to be habitually transported from place to place with an army in the field and are therefore the least mobile and most restricted in their movements. The *matériel* for siege batteries in the United States army are in the hands of coast artillery companies, but batteries are not organized as such until actual operations demand their use. *Field batteries* consist of four or more guns with full equipment of men, horses, carriages, caissons, etc., designed and organized for service with troops in the field. *Horse artillery batteries* are the most mobile of all and act with the cavalry. In this the gunners are mounted. *Mountain, mule, bullock, or elephant batteries* consist of guns and carriages so constructed that they may be taken apart and transported on the backs

of animals, the gun ordinarily forming a load for one animal—the carriage for one or more; but sometimes a *jointed* gun is used which is carried by two or more animals. (See MOUNTAIN ARTILLERY.) Movable batteries are organized into battalions, regiments, brigades, etc., while fixed batteries are units of combat in themselves or are organized into *fire commands* and *battle commands*.

Battery, in a naval sense, is used to denote all the guns of a ship; all the guns on one side, as the *starboard battery*, the *port battery*; a certain part of the guns, as the *gun-deck battery*, *rapid-fire battery*, *six-inch battery*; all the heavy guns, those of 8" calibre and upward, constitute the *main battery*; all smaller rapid-fire guns, the *secondary battery*, etc. See ARTILLERY; COAST ARTILLERY; FIELD ARTILLERY; CANNON; SIEGE GUNS; ARMOR PLATE; FORTIFICATION; SHIPS, ARMORED; TACTICS, MILITARY.

BATTERY. See ASSAULT AND BATTERY.

BATTERY (in electricity). See VOLTAIC CELL; GALVANIC BATTERY; ELECTRICITY.

BATTERY, THE. A tract of 21 acres forming the southern point of the city of New York, the site of fortifications erected by the Dutch, and later a public park. In the early history of the city the north side of the Battery was lined with the most aristocratic residences. The view of the rivers and bay from the Battery wall is unsurpassed, and the park is still a much-frequented pleasure ground, though much disfigured by the elevated railroads which cross it. The park contains the Barge Office, Castle Garden, now the Aquarium, and a statue of Giovanni da Verrazano, who is believed to have reached the mouth of the Hudson River in 1554, though it remained for Hudson to demonstrate the extent and importance of the river.

BATTEUX, bâ'tê', CHARLES (1713-80). A French philosopher and writer on æsthetics. He was born at Alland'huy, near Vouziers (Ardennes), and studied theology at Rheims. Upon his ordination as priest he went to Paris, where he became professor of Greek and Latin philosophy at the Collège de France. His works, chiefly on æsthetics, enunciate the principle that art is not an imitation of nature as such, but of the element of the beautiful in nature, the faithful imitation or interpretation of which is regulated by the innate sense of taste. This theory (*Theorie der schonen Kunst*) may be traced in *Cours de belles-lettres* (5 vols., 1765), a later edition of which appeared under the title of *Principes abrégés de la littérature* (6 vols., 1824). This work is an amplification of an earlier work entitled *Les beaux-arts réduits à un même principe* (1746).

BATHYÁNYI, bôt'yä-nyé. A celebrated Hungarian family. It traces its origin back to a companion of Arpád, the Magyar invader of Hungary (about 894). It has given to Hungary many warriors and statesmen. The surname is derived from lands obtained in the fourteenth century.—FRANCIS BATHYÁNYI (died 1566) distinguished himself at the battle of Mohács, 1526.—BALTHAZAR BATHYÁNYI, who was the head of the family in the latter half of the sixteenth century, fought with distinction in the Turkish wars.—Prince CHARLES BATHYÁNYI, a lieutenant field marshal of the empire, distinguished himself in the Austrian War of Succession, particularly by a victory over the French and Bavarians at Pfaffenhofen, on April 15, 1745.—Count CASIMIR BATHYÁNYI, a mem-

ber of the principal branch of the family, was born June 4, 1807. He was Minister of Foreign Affairs in Hungary during the Revolution of 1848-49, in which he also distinguished himself as a military governor. After the triumph of the Austrians, he fled with Kossuth into Turkish territory, where he remained until 1851. He then went to France, and died in Paris, July 13, 1854.—Count LOUIS BATTYÁNYI, belonging to another branch of the same family, and born at Presburg in 1809, espoused the national cause, yet sought to maintain the connection with Austria and his allegiance to the Austrian sovereign. He was appointed President of the Ministry when Hungary obtained a ministry of its own, in March, 1848. When the breach between Hungary and the Hapsburgs widened into open war, he resigned and afterward took part in public affairs, chiefly as a member of the Diet. After the Austrians entered Pesth he was arrested, in January, 1849, and on October 6 was executed. Consult Horváth, *Graf Ludwig Batthyányi* (Hamburg, 1850).

BATTIADÆ (Gk. *Battiadai*, *Battiadai*, descendants of Battus). Kings of Cyrene for eight generations. 1. **BATTUS I**, founder and first King of the Greek colony of Cyrene in Libya. He came from the island of Thera and was directed to the site of Cyrene by the Delphic oracle. The generally accepted date—not historically certain—of the settlement is about 630 B.C. Battus I ruled 40 years, according to Herodotus. 2. **ARCESILAUS I**, son of Battus I, and second King of Cyrene. According to Herodotus, he ruled 16 years. 3. **BATTUS II** (called "The Blessed," or "The Wealthy," *Ὁ Εὐδαίμων*, son of Arcesilaus I, and third King of Cyrene. In his reign immigrants were invited from Peloponnesus, Crete, and elsewhere, under the promise of a new division of lands. These lands were taken from the Libyans, who turned for aid to the Egyptian King, Apries. A battle was fought in 570 B.C. at Irasa, in which the Cyrenæans were victorious. Cyrene now increased greatly in power and importance. 4. **ARCESILAUS II** (called "The Oppressive," *Ὁ Χαλεπός*), son of Battus II, whom he succeeded on the throne. He began to rule, according to Herodotus, about 560 B.C. Dissensions arose between him and his brothers, in consequence of which the latter withdrew from Cyrene and founded Barca. He met with a severe defeat at the hands of the Libyans and was finally murdered by his brother Haliarchus, or Learchus (550 B.C.). His murder was afterward avenged by his wife, Eryxo. 5. **BATTUS III** (called "The Lame," *Ὁ Χωλός*), son and successor of the preceding. In his reign the Cyrenæans, despairing of the condition of the state, invited, by advice of the Delphic oracle, Demonax of Mantinea to their city to govern their affairs. At this time under his guidance a constitution was framed, by which the powers and privileges of the King were greatly curtailed. 6. **ARCESILAUS III**, son and successor of Battus III. Attempting to overthrow the power of Demonax, he was unsuccessful and fled to Samos. He there, with the help of Polycrates, collected a large army and, returning to Cyrene, wreaked terrible vengeance on his enemies. After Cambyzes had subjugated Egypt, Arcesilaus submitted to the Persian King. Afterward he withdrew to Barca and was there slain by the King, Alazir. His death was avenged by his mother. 7. **BATTUS IV**, son of the preceding, and seventh King of Cyrene. 8. **ARCESILAUS IV**, son and

successor of Battus IV, was the last King of Cyrene. He won a chariot race at the Pythian Games in 462 B.C. and is celebrated therefor in Pindar's fourth and fifth Pythian odes. He is also said to have won a victory at the Olympic Games in 460 B.C. Shortly after this a revolution broke out at Cyrene, and he fled to Euhesperides and was there slain.

BAT TICKS. See FOREST FLY.

BATTLE (Fr. *bataille*, from Lat. *batuere*, to beat, strike). An engagement or combat between opposing military bodies. All strategic operations in war must culminate in the *battle*, for that alone can give them significance. Whether a commander will attack or fight a defensive battle depends on the previous strategical and tactical operations, on the general plans of the commander-in-chief, and on the condition and the particular situation in which his army finds itself at the time it meets the adversary. The tactical offensive is usually preferred as promising more decisive results; but the tactical defensive is often forced on an army. When the hostile armies meet, the commander of the column in question is properly with the advance guard (q.v.). The leading battalion forms line of company, columns of sections, and advances with a light skirmish line in front; the engineers and bridge train halt, and the battery of the advance guard takes up a preparatory position.

A *defensive* battle may be purely defensive, or (the usual case) it may be only temporarily defensive, its object being to gain time. The first consideration is a good position, and this must be carefully intrenched, provided there is time; but all intrenchments should be entirely hidden from the enemy. This position is not occupied at the beginning, but the troops are first assembled in a preparatory position. The positions available for the artillery usually decide the grouping of the forces, except in covered country, when the infantry line has the preference, and the artillery finds positions in rear. As the battle advances, it takes more and more the character of a truly offensive action. Retreats are difficult, even when voluntary. When night intervenes after the battle, a considerable distance may be placed between the two forces and the units somewhat reorganized. The artillery usually furnishes the first support against pursuit, and it is protected by the cavalry, and this leads gradually to the formation of a rear guard.

Reference should be made to the article TACTICS, MILITARY, where will be found an account of the strategy and tactics used in active military operations, including a complete bibliography. That article also discusses the tactics peculiar to the various arms. See ARMY ORGANIZATION; ADVANCE GUARD; ATTACK; RECONNAISSANCE; COAST DEFENSE; FORTIFICATION; OUTPOST; ETC.

BATTLE, TRIAL BY, OR WAGER OF. The determination of a controversy by a physical combat, conducted in the presence of judges and according to fixed judicial rules. Although "it prevails among all the races from which Britain derived its Teutonic blood," it was not a legal institution of Anglo-Saxon England, but was introduced into Britain by William the Conqueror. Sir James Fitzjames Stephen has expressed the opinion that "trial by battle was only private war under regulations." This view is rejected by Pollock and Maitland, however, as well as by other writers, who consider it a

social process for the discovery of the truth. "What triumphed was not brute force, but the truth. The combatant who was worsted was a convicted perjurer." Such was the theory underlying this form of trial.

It was employed both in criminal and civil controversies, but by Bracton's time it was limited to appeals of felony in criminal cases and to the writ of right in civil cases. In the former the combat was between the prosecutor of the felony and the alleged felon, unless one or the other was of unfit age or sex, where his or her place might be taken by a champion. In the civil proceeding by writ of right (the final remedy by a claimant of real property who could not rely on recent possession), either party could appear by champion. This led to the use of professional pugilists and to the business of training and keeping such champions for hire. By the time of Edward I any defendant to whom trial by battle was offered could decline and demand a trial by jury. On the other hand, the defendant, at least in an appeal of felony, retained the legal right to compel his prosecutor to do battle, until 1819, when the Statute of 59 George III, c. 46, enacted that "all appeals of treason, murder, felony, or other offenses shall cease," and that there should be no wager of battle either in criminal or civil controversies. Attempts had been made during the reigns of James I and Charles I to abolish trial by battle, but without success, and its abolition in 1819 was due to the decision of the Court of King's Bench, in *Ashford v. Thornton* (reported in 1 Barnewall and Alderson, 405) that the defendant in an appeal of felony, who had demanded trial by battle, was entitled to it as "his lawful mode of trial." In Scotland this mode of trial came to an end late in the sixteenth century, and throughout Britain it was practically obsolete from that time. Consult: Stephen, *History of the Criminal Law of England* (London, 1883); Pollock and Maitland, *History of English Law* (2d ed. Boston, 1899); Neilson, *Trial by Combat* (London, 1890).

BATTLE. A market town of Sussex, England, 7 miles northwest of Hastings (Map: England, G 6). Pop., 1901, 2991; 1911, 2924. Its name and title to distinction arise from the celebrated Battle Abbey, founded by William the Conqueror to commemorate his victory over Harold, the Saxon King, in 1066. Although generally called the Battle of Hastings (q.v.), the conflict took place on Senlac Hill (now Battle Hill), and the abbey is supposed to mark the spot where Harold fell. At the Reformation the abbey was converted into a private residential mansion; it is open to visitors once a week. The "Roll of Battle Abbey" contained a list of the Norman nobles in the suite of the Conqueror. It was formerly deposited in the abbey and was destroyed in the burning of Cowdray House in 1793. Ten copies exist, but the "roll" is considered to have been of apocryphal origin. Consult: Walcott, *History of Battle Abbey* (London, 1867); Hawthorne, *English Note-Books* (Boston, 1870); Duchess of Cleveland, *The Roll of Battle Abbey* (London, 1889).

BATTLE ABOVE THE CLOUDS, THE. In United States history, the name applied to that part of the battle of Chattanooga which resulted in the capture of Lookout Mountain by General Hooker, Nov. 24, 1863. See CHATTANOOGA, BATTLE OF.

BATTLE CREEK. A city in Calhoun Co., Mich., 121 miles by rail west of Detroit; at the confluence of the Kalamazoo River with Battle Creek, and on the Michigan Central and the Chicago and Grand Trunk railroads (Map: Michigan, D 6). The public-school library (20,000 vols.) occupies a fine building. Other prominent structures include the post office, the central school and city hall buildings, the Sanitarium, Post Tavern, Post Building, Ward Building, and Post Theatre. There are four parks, one of which, at Goguac Lake, is a popular summer resort, and a school museum. The city was formerly the headquarters of the Seventh-Day Adventist denomination, which still maintains here a widely known sanitarium, with a hospital and dormitory, homes for children and the aged, and a college. The tabernacle of this denomination has an auditorium with a seating capacity of 3500, one of the largest ecclesiastical halls in the State. Battle Creek is the centre of a fertile agricultural district and controls a considerable trade in the products of the region, principally grain, fruit, live stock, and wool, as well as in its most important manufactured products; threshing machines and other agricultural implements, pumps, engines, flour, printing presses, and hose fixtures. The city enjoys a national reputation for its cereal foods. The repair shops of the Chicago and Grand Trunk Railroad are situated here. Manufacturing interests are promoted by excellent water power. Settled about 1835, Battle Creek was incorporated as a village in 1850, and nine years later received a city charter. It adopted the commission form of government in 1913. The water works are the property of the municipality. Pop., 1890, 13,197; 1900, 18,563; 1910, 25,267.

BATTLEFORD. A trading town in the province of Saskatchewan, Canada, at the confluence of the Saskatchewan and Battle rivers, and on the Canadian Northern and Grand Trunk Pacific railroads (Map: Northwest Territories, H 4). It is the centre and supply station for a large farming and grazing district, is the headquarters for a troop of Canadian mounted police, and is the seat of an Indian Agency. From 1876 to 1883 this town was the capital of the Northwest Territories. Pop., 1901, 797; 1906, 800; 1911, 1335.

BATTLE HYMN OF THE REPUBLIC, THE. A stirring poem by Julia Ward Howe (1862), published in the *Atlantic Monthly*. The music is that of the song, "John Brown's Body."

BATTLEMENT (evidently from unrecorded OF. **bastillement*, from OF. *bastiller*, to fortify,

BATTLEMENT.

bastir, Fr. *bâtir*, to build; cf. *bastille*, fortress). A term describing the parapet of mediæval de-

fensive towers and walls. The parapet is formed by a number of rising parts known as *cops* or *merlons*, the intervening spaces called *crevelles*. The soldier would take shelter behind the *merlon*, while he fired through the *crevelle*. Good examples are found on the towers of old castles throughout Europe; and on churches, armories, and other public buildings in the United States, where they are employed for their architectural value.

BATTLE MONUMENT. 1. An abbey erected on the site of the battle of Hastings by William the Conqueror. The remains of it exist to this day. 2. A monument, 72 feet high, erected in 1815, at Baltimore, Md., in memory of those who defended the city against the British in September, 1814.

BATTLE OF HASTINGS. See HASTINGS, BATTLE OF.

BATTLE OF IS'SUS, THE. A battle fought 333 B.C., in which Alexander defeated Darius, King of Persia, with great loss. The Persian Queen and her family were captured. The Macedonian loss was estimated to be only 300 foot and 100 horse. The battle was made the subject of a famous mosaic, which was once in the House of the Faun at Pompeii and is now preserved at the Museo Nazionale, Naples. For the mosaic, consult Mau-Kelsey, *Pompeii* (New York, 1902). See ALEXANDER THE GREAT.

BATTLE OF SHARPSBURG. See ANTIETAM, BATTLE OF.

BATTLE OF THE BAL TIC. See PRAGUE.

BATTLE OF THE BOOKS. The title of a famous book by Jonathan Swift, which grew out of the controversy over the comparative merits of ancient and modern literature. The controversy was started in France by Charles Perrault (q.v.). In 1687 he read before the Académie a poem called *Le siècle de Louis le Grand*, in which he aroused the classicists by placing the moderns above the ancients. He was assailed by Boileau in *Réflexions sur Longin* (1693) and in other works. Perrault subsequently elaborated his position in the *Parallèle des anciens et des modernes* (1688-96). The dispute was taken up by English scholars. Sir William Temple sided with the ancients, and William Wotton to some degree with the moderns. The dispute developed into a literary controversy over the Epistles of Phalaris, in which Dr. Bentley showed his learning at the expense of Charles Boyle. Swift burlesqued the whole affair by giving a "full and true account of the battle fought last Friday between the ancient and modern books in Saint James's Library," of which Richard Bentley was librarian. See BENTLEY, RICHARD.

BATTLE OF THE FROGS AND MICE. See BATRACHOMYOMACHIA.

BATTLE OF THE KEGS. See HOPKINSON, FRANCIS.

BATTLE OF THE SPURS. See COURTRAI; GUINEGATE.

BATTLESHIP. In old naval parlance a line-of-battle ship was a vessel carrying batteries of guns on two or more covered decks and intended, in a fleet action, to lie in the line of battle. The modern battleship is a vessel of war in which are combined the greatest possible offensive and defensive powers and as great speed as can be given without serious reduction of these powers. The development of the modern battleship will be found under SHIPS, ARMORED; for other information concerning it, see NAVIES;

CRUISER; UNITED STATES, Navy; FRIGATE; ETC.

BATTONI, bāt-tō'né. See BATONI, POMPEO.

BATTONYA, bōt'tō-nyō. A market town of the county of Csanád, Hungary, about 60 miles east of Szegedin. Its principal industries are connected with the production of tobacco and wine, and the cattle raising of the district (Map: Hungary, G 3). Pop., 1900, 12,872.

BATTUE, bāt'tū (Fr. from *battre*, to beat, strike). The method adopted in many parts of the world for driving wild animals to a point where the huntsman is secreted ready to kill them. Specifically, battue means to-day the spreading of beaters over the moors of Scotland, Ireland, and the north of England in a wide circle and gathering them to a narrower one, whereby the grouse are driven past groups of gunners and shot at from cover. Similar tactics are employed with partridge, particularly in the open lands of the east of England; and the woods and coppices in England are beaten to drive the pheasants out of the timber and undergrowth and over the guns stationed on the adjacent pastures. In India modifications of this method are used in tiger hunting, and in driving elephants into inclosures from which they cannot escape. In Patagonia the natives surround the guanacos in the same way.

In Australia rabbit driving has been frequently resorted to in regions where the animal has become a pest, and the same applies to certain of the western United States, where wolf driving is also practiced when necessary. Generally speaking, the driving of game in the European fashion is considered unsportsmanlike in America, this sentiment being reflected by the prohibition in most States of the hounding of deer. See HUNTING.

BATTUS. See BATTIADÆ.

BATUA. See BATWA.

BATU KHAN, bā-tūō'kūn (?-1256). The leader of the Mongols in their invasion of Europe in the thirteenth century, grandson of Genghis Khan and nephew of Ogotai Khan. Given command in 1235 of the Mongol army destined against Europe, he marched westward, crossed the Volga River, and dividing his forces sent one southward to bring the Bulgarians to submission, while with the main army he advanced into the heart of Russia. On Dec. 21, 1237, he assaulted and took the city of Riazan. After this he captured Moscow, Vladimir, and, in 1240, Kiev, his followers everywhere perpetrating horrible atrocities. "The villages disappeared, and the heads of the Russians fell like grass before the sickle." The Russian princes were forced to bow to the Mongol yoke. In 1241 Batu Khan advanced into Hungary and overwhelmed the army of Béla IV. At the same time another Mongol army advanced against the Poles. It ravaged Poland and destroyed Cracow. On the memorable field of the Wahlstatt, near Liegnitz, the forces of the Silesian duke and the Teutonic knights succumbed to the Mongols, who, however, were unable to pursue their progress owing to their heavy losses. From the German frontier to the Volga, hardly a town survived the passage of this tornado of war. In 1242 Batu Khan was recalled to Asia by the news of the death of Ogotai. He died in 1256 in the midst of preparation for further conquests. In his campaigns Batu's main army was preceded by a body of 40,000 men, who cut roads and acted as pioneers through the terribly diffi-

cult country. The secret of the military success of the Mongols was the incredible speed with which they marched, often covering, it was said, a distance of nearly 300 miles in three days. The khanate which Batu governed was Kiptchak, a region extending from the Jaxartes in Turkestan to the limits of Russia of the thirteenth century and comprising the region north of the Caucasus. Batu's army was named the Golden Horde (q.v.), because of his tent, which was richly covered with embroidery and gilded leather. The *sira ordu*, or silken palace, made the great encampment by the Volga known as Sarai, the capital of the Golden Horde. The cause of the Mongol success lay in the fact that the whole Tatar nation was a standing army, which struck Europe in a time of feudalism, when patriotism was parochial, Russia without national unity, only the nobles and free men armed, and the number of monks, hired servants, and slaves in overwhelming majority. On the other hand, the Tatar cavalry was superbly disciplined, with admirable tactics, while their weapons were far superior to anything then known in Europe. Their arrows were longer and heavier, and their engineering skill far in advance of that of their foes. Their horses were of the Tatar breed, which could find food for themselves by brushing the snow away with their noses, where Western horses would starve. Consult: Howorth, *History of the Mongols* (London, 1880); Hammer-Purgstall, *Geschichte der Goldenen Horde in Kiptschak* (Pesth, 1840); Banking, *Wars of the Mongols* (London, 1827).

BATUM, bâ-tûm', or **BATOUM**. Formerly a Turkish fortified city, now a Russian port in the province of Batum (area, 2700 square miles; pop., 1911, 166,300), on the southeastern shore of the Black Sea, about 8 miles north of the Turkish frontier (Map: Russia, F 6). The Berlin Congress of 1878, in sanctioning the cession of Batum to Russia, stipulated that it should not be made into a naval station, but should remain an essentially commercial port. It remained a free port until 1886. After the collapse of a quay in 1911 extensive improvements have made the harbor one of the best on the east coast of the Black Sea, and the city is a naval station. The climate is warm and mild, almost tropical; lemons, oranges, camellias, and even palms thrive in the open air. The city has but few well-appointed houses, and its sanitary conditions are very imperfect, but there is a fine park, and a cathedral completed in 1903. An extensive trade is carried on, Batum being a great emporium for the export of petroleum, which is extensively transported by means of pipe lines and tank cars. Other articles of commerce are petroleum products, wool, timber, tin plate, bricks, wheat, manganese ore, and articles from Transcaucasia. It is the seat of a United States consul. Pop., 1889, 23,200; 1897, 28,509; 1911, 30,008, composed chiefly of Russians, Turks, Greeks, Armenians, and Persians.

BATWA, bâ'twâ. A pigmy tribe in the mountainous country of the Wissmann Falls district, southern Central Africa. According to Verner, they are sometimes less than 4 feet high; their heads are small and well shaped, their eyes small, bright, and deeply set, and their color chocolate; they are trimly built and symmetrical, with leg muscles well developed, and arms less so; the feet and hands are

small and well formed; the hair is kinky, and there is no beard. The villages are not regularly laid out; the houses are beehive-shape. The Batwa are under the protection of the Bakuba, who have taught them to cultivate a few vegetables. They are by habit meat eaters. In addition larvæ of insects and wild roots are eaten. Their weapons are bows, arrows, and knives. The boys are taught to hunt, and the girls dig edible roots. Household furniture consists of a few Bakuba earthen pots, a bed of sticks woven together, baskets, quivers, nets, and bamboo fish traps. They do not make pottery, weave, or work metals, and have no musical instruments. The bruised root of a species of Euphorbia furnishes arrow poison. Their knowledge of the habits of wild animals is remarkable, and sight, smell, and hearing are well developed. They are monogamous and faithful and affectionate toward their children. Charms and amulets are worn. In their funeral customs the men abstain from hunting and dancing, while the women remain in the huts and weep. The name "Batwa," also written "Batua," has in addition a much wider application, being used of a considerable number of different pigmy tribes, especially those sprinkled over the Congo region. Native usage of the term has, however, occasionally produced confusion, inasmuch as tribes shorter than the speakers are designated as Batwa without necessarily falling into the category of pigmies.

BATYUSHKOV, bâ'tûsh-kôf, KONSTANTIN NIKOLAYEVITCH (1787-1855). A famous Russian elegiac poet, the forerunner of Pushkin. He was born at Vologda and educated at St. Petersburg. Here he mastered the Italian, German, and French languages and very early began to write poetry. He entered the military service; took part in 1807 in the Niemen campaign; later was in Finland, and entered Paris with the Army of the Allies in 1814. His unbounded admiration for Voltaire and France had received a rude shock when Moscow was burned by "the modern Vandals"; but the sight of Paris made him forget it all, and he immediately went to Voltaire's grave. In 1818 he was appointed attaché of the Russian Embassy at Naples, and the dream of his life—to visit sunny Italy—was realized; but his happiness did not last long. In 1822, after years of mental aberration, he fell a victim to a brain disease. In addition to his elegies, of which *The Death of Tasso* is perhaps his chief, his original works include epistles and narrative and lyric poems. He also made excellent translations from the Latin of Tibullus, the French of Parny, the Italian of Petrarch, and the German of Matthiäson. His whole life was devoted to the formal perfection of Russian poetry—a struggle from which he came out victorious—so that he is the real teacher of Pushkin in this respect. His prose includes essays on poetry, ethics, and religion. (*On the Influence of Lighter Poetry upon Language* and *A Word about Morals Based on Religion* are two of his titles.) The first collection of his works appeared as early as 1817, when the author was barely 30, under the title, *Experiments in Verse and Prose*. Complete editions were published in 1834 and 1850. The best edition of his works is that by his brother, P. N. Batyushkov (3 vols., St. Petersburg, 1877), with an exhaustive biography by L. N. Maykoff and commentaries by the latter and V. I. Saitov.

BAUAN, bou'ân, or **BAUANG**, bou'âng. A town of Luzon, Philippines, in the province of Batangas (Map: Luzon, F 12). It is situated at the head of Batangas Bay, 4 miles northwest of Batangas, the capital of the province. The town manufactures piña cloth embroidery and is a centre for the marketing of agricultural products. Pop., 1903, 39,094.

BAÜBO (Gk. *Bauβó*, *Baubō*). A mythical woman of Eleusis, whom Hesychius calls "the Nurse of Demeter" and about whom there are many stories. These seem to have been the inventions of later times, coined for the purpose of giving a mythical origin to the jokes in which women used to indulge at the festival of Demeter. She was in some way connected with the Eleusinian Mysteries and is introduced by Goethe into the second part of *Faust* as the type of feminine lust.

BAUCHER, bô'shâ', FRANÇOIS (1796-1873). A French hippologist, born in Versailles. He published a new system of equestrian training, under the title of *Méthode d'équitation basée sur des nouveaux principes* (1842)—a unique work, which occasioned considerable comment and which has been translated into several European languages (Eng. trans. under the title *A New Method of Horsemanship*, Philadelphia, 1856). Under Napoleon III Baucher was appointed to a position in the Imperial *manège*.

BAUCIS. See PHILEMON AND BAUCIS.

BAUDELAIRE, bôd'lar', CHARLES (1821-67). A French poet, born in Paris, April 9, 1821. He was the forerunner of the decadent and even degenerate school in modern French poetry, and in his kind greater than any of his successors. His parents sought to turn him from literature by travel in the Orient, and, as might have been foreseen, confirmed him in his perversity. The imagery, the colors, the odors of those scenes, that splendid nature, new and strange, fired his eccentric imagination and seemed to command a poetic expression. Yet at first this morbid hyperæsthesia, which was to rise at times to emotional hysteria, was controlled by a strong critical bent. Baudelaire's early essays show remarkable keenness and prescience in regard to the trend of lyric poetry, and his translations of Poe's *Tales* (1856) made that author almost as much a classic of French as of American romantic fiction. But Baudelaire's cardinal work in French literature is the *Fleurs du Mal* (Flowers of Evil), 1857, in which the restless reaction from the confident outlook of scientific determinism finds its first, its most morbidly pessimistic, and possibly its strongest expression. Baudelaire lived for 10 years longer, "cultivating hysteria with delight and terror," as he tells us, and died in a hospital at last after a year of semi-lunacy induced by the excessive use of nervous stimulants. Baudelaire's topsyturvy ethics regard nature as evil, the natural as ugly, decay as a release, and death as a blessing. Possibly he was insincere; certainly he was intentionally brutal, and strained after effects in "the last convulsions of expiring individualism," as though drunk with the lees of romantic wine. There are 151 of these rank night-shade *Flowers*, all short poems, compactly built, with a mastery of technique unsurpassed in France, carefully polished and elaborated moral paradoxes, in which a shuddering at the vileness of life alternates with futile aspirations for an emancipation from it. In this respect he is the predecessor of Paul Verlaine

(q.v.), of whom it has been said: "He often sat down, reeking with the odors of the foulest of Parisian *gargotes*, to pour out in verse of almost superhuman sweetness the aspirations of a soul profoundly touched with religious yearning." And what Baudelaire was as a poet, that Joris-Karl Huysmans was as a writer of remarkable prose. (See HUYSMANS, J. K.) Even while Baudelaire worshiped Satan, he clung to the Cross and became towards the close of his life as morosely ascetic in resolution as he was extravagantly hedonistic in action. In his prose, as in his verse, the philosophy of science and the ethics of materialism coexist with the mysticism of mediæval demonology. His ethics are pessimism reduced to the absurd, his æsthetics are a reduction to the absurd of art; yet his poetry, in spite of all its artistic theory and ethical teaching, has a perverse poisonous originality that like arsenic preserves his memory green. The *Fleurs du Mal* have scattered their seeds wide, and Baudelaire is often called the father of the decadent Symbolists. Baudelaire's known works were published in 7 vols. (Paris, 1868); but certain poems that were suppressed under this Empire appeared in a recension by Mallarmé, *Le Tombeau de Ch. Baudelaire* (Paris, 1896); while the Vicomte de Louvenjoul (q.v.) edited the curious revelation *Mon Cœur Mis à Nu* (Paris, 1908). A considerable literature has sprung up around the life and writings of Baudelaire, and it is possible here to mention only the most important works, such as Henry James, *French Poets and Novelists* (London, 1884); Asselineau, *Ch. Baudelaire: sa vie et son œuvre* (Paris, 1889); G. Kahn, *Les Symbolistes et les Décadents* (Paris, 1902); F. Gautier, *Ch. Baudelaire* (last ed., Brussels, 1904); and the essays by Paul Bourget. Several attempts have been made to render some of the *Fleurs du Mal* into English verse, the most successful being that of A. Symons (London, 1905). One should also read the strangely morbid yet fascinating picture of Baudelaire given by Huysmans in the character of Des Esseintes in *A Rebours* (Eng. trans., London, 1897). See also MALLARMÉ, STÉPHANE, and FRENCH LITERATURE.

BAUDENS, bô'dân', JEAN BAPTISTE LUCIEN (1804-57). A French surgeon. He was born at Aire, in the department of Pas-de-Calais, and studied at the medical school in Paris. In 1823 he became connected with the hospital at Lille and afterward lived in Strassburg. In 1826 he was made a surgeon to the military hospital in Paris, and from 1830 acted as army surgeon at Algiers, where he founded a hospital for instruction. His writings include: *Clinique des plaies d'armes à feu* (1836) and *Nouvelle méthode des amputations* (1842). His original contributions consisted mainly in improvements of the surgical treatment of bullet wounds.

BAUDHAYANA, boud-hâ'yâ-nâ. An early Hindu teacher or lawgiver. See APASTAMBA; GAUTAMA; VASISHTA.

BAUDIN, bô'dân', CHARLES (1784-1854). A French admiral, born at Sedan. In an engagement fought in Indian waters between the French ship *Sémillante* and the English frigate *Terpsichore* in 1808 he lost an arm and was shortly afterward promoted lieutenant of the vessel. In June, 1812, while conveying a fleet of 12 French transports laden with ammunition to Toulon, he was pursued by English cruisers, but effected his escape and subsequently inflicted heavy damage upon a brig attached to the Eng-

lish squadron. After the battle of Waterloo Baudin volunteered to conduct the Emperor successfully through the cordon of English cruisers that guarded the coast of France. He was appointed rear-admiral in 1838, was intrusted with the command of the fleet of 23 vessels sent against Mexico, and on Nov. 27, 1838, bombarded San Juan de Ulúa, the defenses of Vera Cruz, which capitulated the following day. He retired from active service in 1849.

BAUDISSION, bou'dis-sin, *Fr. pron. bô'dê'-sân*, WOLF HEINRICH, GRAF VON (1789-1878). A German translator, born at Rantzau, in Holstein. He entered the diplomatic service of Denmark in 1810, and became Secretary of Legation successively at Stockholm, Vienna, and Paris. In 1827 he settled at Dresden, where he collaborated with Tieck in his famous German translation of Shakespeare. The following plays were translated by Baudission and were revised and annotated by Tieck: *Othello*; *King Lear*; *Much Ado About Nothing*; *Comedy of Errors*; *Taming of the Shrew*; *Measure for Measure*; *All's Well that Ends Well*; *Troilus and Cressida*; *Love's Labor's Lost*; *Merry Wives of Windsor*; *Titus Andronicus*; *Antony and Cleopatra*. Among Baudission's other German translations are Hartmann's *Iwein* and the comedies of Molière (4 vols., 1865-67).

BAUDISSION, WOLF WILHELM, GRAF VON (1847-). A German theologian, born at Sophienhof, Holstein. He studied at Berlin, Erlangen, Leipzig, and Kiel, and was professor at Strassburg from 1876 to 1881. From 1881 to 1900 he was professor at Marburg and in the latter year was called to Berlin. He published: *Translationis Antiquæ Arabicæ Libri Jobi quæ Supersunt* (1870); *Studien zur semitischen Religionsgeschichte* (1876-78); *Die Geschichte des alttestamentlichen Priesterthums untersucht* (1889); *August Dillmann* (1895); *Einleitung in die Bücher des Alten Testaments* (1901); *Adams und Esau, eine Untersuchung zur Geschichte des Glaubens an Auferstehungsgötter und an Heilgötter* (1911).

BAUDRICK. See BALDRIC.

BAUDRILLART, bô'drê'yâr', HENRI JOSEPH LÉON (1821-92). A French political economist and author. He was born in Paris, studied at the Collège Bourbon, and after 1855 was editor of the *Journal des Economistes*. In 1866 he was appointed professor of history and political economy in the Collège de France, in 1869 general inspector of libraries, and in 1881 a professor in the Ecole des Ponts et Chaussées. He published *Manuel d'économie politique* (1857), *Les populations agricoles de la France* (1880-88), and other works.

BAUDRY, bô'drê', PAUL JACQUES AIMÉ (1828-86). A French decorative, figure, and portrait painter. He was born at La Roche-sur-Yon, Vendée, and studied with Drölling in the Ecole des Beaux-Arts, Paris, whither he was sent with a stipend from his native city. Having won the Grand Prix in 1850, he studied in Rome, forming himself especially after the great Venetian masters. After his return he speedily rose to the front rank among contemporaneous artists, became a member of the Institute in 1870, and commander of the Legion of Honor in 1875. He first distinguished himself in figure and portrait painting. One of his most charming figure pieces is the "Pearl and the Wave," and he is represented in the Musée de Luxem-

bourg by "Fate and the Child" and "Truth" and by canvases in several of the provincial museums of France. Among his sitters were many prominent representatives of art, literature, and finance and of the aristocracy of France, but he is most celebrated as a decorative painter, his works in the grand foyer of the Opera House in Paris (1866-74) ranking among the most brilliant creations of modern art. His masterpiece, however, is "The Glorification of the Law," adorning the ceiling in the Palace of Justice, which brought him the Medal of Honor in 1881. Consult Charles Ephrussi, *Paul Baudry, sa vie et son œuvre* (Paris, 1887).

BAUER, bou'ér, ADOLF (1855-). An Austrian classical scholar, born at Prague. He studied at the universities of Vienna, Berlin, and Bonn, and in 1891 was appointed professor of ancient history at the University of Graz. The most important of his publications are: *Die Entstehung des herodotischen Geschichtswerkes* (1878); *Themistokles* (1881); *Die griechischen Kriegsalterthümer* (1886); *Litterarische und historische Forschungen zu Aristoteles' 'Αθηναίων Πολιτεία* (1891); *Die Forschungen zur griechischen Geschichte 1888-98* (1899); *Lehrbuch der Allgemeinen Geschichte* (1904); *Lehrbuch der Geschichte des Altertums* (1904); *Die Aufgabe des Gymnasiums* (1908); *Ursprung und Fortwirken der Christliche Weltchronik* (1910).

BAUER, ANTON (1772-1843). A German jurist and criminologist, born at Marburg. He was appointed professor at Göttingen in 1813. He is known as the originator of a theory of punishment according to which punishment finds its justification in the warning conveyed by the penalty. His works include: *Grundsätze des peinlichen Rechts* (1806), later published as *Lehrbuch des Strafprozesses* (1835), the first text-book of the science, and *Die Warnungstheorie* (1830).

BAUER, BRUNO (1809-82). A rationalistic German critic. He was born at Eisenberg, in the duchy of Saxe-Altenburg, on Sept. 6, 1809. He was the son of a porcelain painter and studied at the University of Berlin, where he became privat-docent in the theological faculty in 1834. He was transferred to the University of Bonn in 1839, but was deprived of his lectureship in 1842 on account of his rationalistic boldness. He then removed to Berlin and for many years devoted himself to the destructive criticism of the Scriptures until, having to his own satisfaction shown that they had no authority, he abandoned such studies and devoted himself chiefly to historical and critical publications. His writings are very numerous. All of them exhibit great learning, industry, research, and acumen, but are completely antagonistic to the received opinions in theology or to any form of evangelical religion. For instance, in his *Christus und die Cäsaren* (Berlin, 1877; 2d ed., 1879), he claims that Christianity was really founded by Seneca! He is generally admitted to be quicker in the discovery of error than of truth. He died at Rixdorf, a suburb of Berlin, April 15, 1882. Consult Lichtenberger, *German Theology in the Nineteenth Century* (Eng. trans.).

BAUER, EDGAR (1820-86). A German publicist, brother of Bruno Bauer, born at Charlottenburg. He studied theology and jurisprudence at Berlin and divided his time between travel, literary work, and conflicts with the law. He

served a term of imprisonment for having written *Der Streit der Kritik mit der Kirche und dem Staat*, which was confiscated by the Prussian authorities, but was afterward republished in Bern (1843). His other writings include *Die Rechte des Herzogtums Holstein* (1863); *Die Deutschen und ihre Nachbarn* (1870); *Das deutsche Reich in seiner geschichtlichen Gestalt* (1872); *Das Kapital und die Kapitalmacht* (1884, 1888).

BAUER, GEORG. See AGRICOLA.

BAUER, HAROLD (1873-). A celebrated pianist. He was born in London, April 28, 1873, of a German father and an English mother. His father taught him the violin and piano, on both of which instruments the boy made remarkable progress. When he was eight years of age, he was placed under Adolf Pollitzer to be trained as a violin virtuoso. After but two years of further study he made his first successful tour of England as a violinist, in 1883. For the next nine years he continued this career. In 1892 Paderewski heard him play the piano in Paris and predicted a great career for him, if he would devote himself entirely to that instrument. Bauer took the master's advice and became Paderewski's pupil for one year. In 1893 he made his first concert tour as a pianist, through Russia, and then returned to Paris to be heard and at once to become the lion of the hour. His enthusiastic reception from the French induced him to take up his permanent residence in Paris, but his fame quickly spread and soon he was a European celebrity. In 1900 he was heard for the first time in America, where he immediately was received as a prime favorite, so that he subsequently made several more tours of this country, always meeting with undiminished favor. In 1913 his New York recital was one of the most notable of the season. Bauer's wonderful velvety tone—capable of an infinite variety of nuances from the softest pianissimo to the most powerful fortissimo—and a technique exhibiting that limpid clearness which is the ideal of the French school, combined to bring him instant recognition, and the most remarkable thing about this master's exquisite art is the fact that it is to be considered practically the result of self study.

BAUER, KAROLINE (1807-77). A German actress. She was born at Heidelberg, made her debut at Karlsruhe in 1822, and had achieved a brilliant success there and at Berlin in both comedy and tragedy, when in 1829 she married in London Prince Leopold of Coburg, afterward King of the Belgians. Their morganatic union was brief and unhappy. In 1831 she returned to the stage, which she quitted only upon her marriage to the Polish Count Ladislas de Broel Plater, in 1844. Thereafter she lived in Switzerland, where she died at Zürich. Her *Posthumous Memoirs*, translated into English (1884) with their denunciations of King Leopold and Baron Stockmar, offer a striking contrast to the two pleasing volumes of theatrical reminiscences that had preceded them in 1876 and 1877.

BAUER, KLARA (known also by the pen name *Karl Detlef*) (1836-76). A German novelist, born at Swinemünde (Pomerania). She became a teacher of pianoforte at St. Petersburg, where for a time she resided in the house of Bismarck, then Minister to Russia. Her writings, distinguished by pure diction and skill in

the delineation of character, include *Unlosliche Bande* (1869; 3d ed., 1877); *Musste es sein?* (2 vols., 1873; 2d ed., 1875); and her best work, *Ein Dokument* (1876; 4 vols., 2d ed., 1878).

BAUER, LOUIS A. (GRICOLA) (1865-). An American astronomer and magnetician, born in Cincinnati, Ohio. He graduated at the University of Cincinnati in 1888 and was appointed astronomical and magnetic computer of the United States Coast and Geodetic Survey. In 1895-96 he was instructor in mathematical physics at the University of Chicago, in 1896-97 instructor there in geophysics, and from 1897 to 1899 associate professor of mathematics and mathematical physics at the University of Cincinnati. He also served as chief of the territorial magnetism division of the United States Coast and Geodetic Survey from 1899 to 1906. He became editor of *Terrestrial Magnetism and Atmospheric Electricity* in 1896. In 1904 he was made director of terrestrial magnetism in the Carnegie Institute. His writings include: *Beiträge zur Kenntniss des Wesens der Secularvariation des Erdmagnetismus* (1895); *Vertical Earth-Air Electric Currents* (1897); *United States Magnetic Tables and Magnetic Charts for 1905* (1908); *Land-Magnetic Observations, 1905-1910* (1913).

BAUERNFEIND, bou'ern-fint, KARL MAXIMILIAN VON (1818-94). A German engineer, born at Arzberg (Franconia). He studied at Nuremberg and Munich, and in 1846 was appointed professor of geodesy and engineering science in the School of Engineering at Munich. In 1868-74 and 1880-83 he was director of the Technical College of Munich, originally organized according to plans devised by him. He retired in 1890. He was the inventor of the prismatic cross, extensively used in surveying. His original investigations were very extensive. Among his numerous works are *Zur Brückenbaukunde* (1854; revised ed., 1878), and *Zur Wasserbaukunde* (1866).

BAUERNFELD, bou'ern-felt, EDUARD VON (1802-90). An Austrian playwright and poet, born in Vienna. After taking an important part in the exciting political events of 1848, he devoted himself to literature. He was a friend of Grillparzer and of Franz Schubert, for whose opera, *Der Graf von Gleichen*, he wrote the libretto. His works, which were varied, included political fiction, poetry, serious drama, and many very successful comedies. These last are marked by clever dialogue and skillful characterization, and include: *Bekenntnisse* (1834); *Bürgerlich und Romantisch* (1835); *Grossjährig* (1846); *Krisen* (1851); *Aus der Gesellschaft* (1866); *Moderne Jugend* (1868); *Der Landfriede* (1869). He was less successful in serious drama. His *Gesammelten Schriften* were published in Vienna (12 vols., 1871-72), and *Ausgewählte Werke*, with a biographical and critical introduction by Emil Hörner (1905). Consult A. Stern, *Bauernfeld, Ein Dichterportrait* (Leipzig, 1891).

BAUGÉ, bô'zhâ. The chief town of an arrondissement of the same name in the department of Maine-et-Loire, France, on the Couesnon, 22 miles northeast of Angers (Map: France, N., E 5). It contains a fine old castle of the fifteenth century, formerly the seat of the dukes of Anjou, and is notable as the scene of an English defeat in 1421, when their leader, the Duke of Clarence, was killed. Pop., 1901, 3325; 1906, 3199; 1911, 3235.

BAUHIN, bô'ân', GASPARD or KASPAR (1560-1624). A Swiss botanist and anatomist. He was born in Basel and became professor of anatomy and botany there in 1588. In 1614 he was made professor of medicine. His most important work is the *Pinax Theatri Botanici* (1623). His work on anatomy, entitled *Theatrum Anatomicum* (1621), has considerable historical value.

BAUHIN, JEAN (1541-1613). A Swiss botanist, brother of Gaspar Bauhin. He devoted his life to the study of botany and published many excellent works, the most important and best known of which is his *Historia Universalis Plantarum Nova et Absolutissima*, completed by others and published after his death (1650).

BAUHINIA (after the botanist Bauhin). A genus of plants of the family Leguminosae. The species, of which there are about 150, are natives of the warmer regions of both hemispheres, and some of them are remarkable for the size and beauty of their flowers. Most of them are twining plants or lianas, stretching from tree to tree in the tropical forests; but some are small trees, as *Bauhinia porrecta*, the mountain ebony of Jamaica, so called from the color of its wood. The inner bark of the Maloo climber, *Bauhinia racemosa*, or *Bauhinia scandens*, and of *Bauhinia parviflora*, East Indian species, is employed for making ropes. *Bauhinia retusa* and *Bauhinia marginata*, also East Indian, exude a brownish-colored mild gum; while the astringent bark of *Bauhinia variegata* is used in Malabar for tanning and dyeing leather, and also in medicine. The flower buds are often pickled. The leaves of various species are used in Brazil as demulcent medicines, having mucilaginous properties. *Bauhinia splendens*, known as chain creeper, is common in South America. Its stems are very flexible and are of great utility.

BAUM, boum, L(YMAN) FRANK (1856-). An American author, best known as the creator of "The Wizard of Oz." He was born at Chittenango, N. Y. After having received an academic education at Syracuse, he entered newspaper work in 1880 and was editor of the *Dakota Pioneer* (1880-90) and of *The Show Window* in Chicago (1897-1902). Besides his writings for children, both in the way of books and in contributions to the magazines for 20 years, he is the author of a number of plays, of which *The Wizard of Oz*, a musical extravaganza (1902), had a long run in New York and Chicago. Among his other works may be mentioned: *Mother Goose in Prose* (1897); *Father Goose—His Book* (1899); *The Wonderful Wizard of Oz* (1900); *Baum's Fairy Tales* (1908); *Sky Island* (1912); *The Patchwork Girl of Oz* (1913); and the plays, *The Maid of Arran* (1881) and *The Queen of Killarney* (1885).

BAUMANN, bou'mán, ALEXANDER (1814-57). An Austrian playwright and composer, born in Vienna. He first became distinguished through his songs and romances in the dialect of Lower Austria and afterward devoted himself to dramatic composition, his comedies being especially popular. They include: *Beiträge zur deutschen Theater* (1849), *Singspiele aus den österreichischen Bergen* (1850), among which the well-known *Das Versprechen hinterm Herd* has maintained its popularity; *Ehrenbusch für d'Oesterreicher Armee in Italien* (1854); *Gebirgsblümeln* (8 books); *Aus der Heimat*.

VOL. II.—50

BAUMANN, OSKAR (1864-99). A German African traveler, born in Vienna. After study in Vienna and Leipzig, he accompanied Lenz (1885) on the latter's journey up the Congo River to Stanley Falls. In 1886 he explored Fernando Po, in 1888 accompanied an expedition to Kilimanjaro, and in 1890 was sent out by the German East African Society for the exploration of parts of East Africa. During 1892-93 he was the leader of an expedition to Victoria Nyanza, explored the region to the south and west of that lake, and ascertained that the Kagera River, which takes its rise in the Mountains of the Moon, is the lake's chief tributary. He wrote *Afrikanische Skizzen* (1900).

BAUMBACH, boum'bäg, RUDOLF (1840-1905). A German poet and novelist. He was born at Kranichfeld, studied natural science at Würzburg and Leipzig, Freiburg and Heidelberg, and afterward lived in Austria till 1885, when he moved to Memingen. He proved most successful in poetic tales based on popular legends of German and the Slavonic Alps: *Zlatorog* (1875), *Horand und Hilde* (1879), *Frau Holde* (1880), *Der Pate des Todes* (1884), *Kaiser Max und seine Jäger* (1888). He has published seven volumes of lyrics, of which *Lieder eines fahrenden Gesellen* (1878) and *Thüringer Lieder* (1891) are characteristic. His most noteworthy novel is *Trug-Gold* (1878), an historical romance of the seventeenth century. He also wrote the fairy stories, *Sommermärchen* (1881) and *Es war einmal* (1889).

BAUMÉ, bô'má', ANTOINE (1728-1804). A French chemist, known for his discoveries in applied chemistry. He became professor in the college of pharmacy in Paris and founded a large establishment for the preparation of drugs. He published many papers on the application of scientific principles to useful purposes in the arts and manufactures. Among his inventions and improvements were processes for bleaching, purifying saltpetre, manufacturing sal-ammoniac, etc. Baumé's areometer is still in common use in laboratories and in manufacturing establishments. His publications include: *Eléments de pharmacie* (1762) and *Chimie expérimentale et raisonnée* (3 vols., 1773).

BAUMEISTER, bou'mi-stér, JOHANN WILHELM (1804-46). A German veterinarian, born at Augsburg. In his youth he received extensive training in animal painting and afterward studied and practiced veterinary medicine. In 1839 he was made professor at the School of Veterinary Medicine at Stuttgart. His published works include *Handbuch der landwirtschaftlichen Tierkunde und Tierzucht* (3 vols., 4th ed., 1863), a part of which, under the title *Anleitung zur Kenntnis des Aeussern des Pferdes*, passed through the seventh edition in 1891. Other parts, too, of the *Handbuch* have been published separately and have passed through several editions. The work was beautifully illustrated by the author.

BÄUMELER, boi'me-lër, or **BIMELER**, bë'me-lër, JOSEPH MICHAEL (1778-1853). The leader of the German "Separatists," who founded the settlement of Zoar, Ohio, in 1817. He was born in Württemberg, Germany, received a good education, and soon identified himself with a group of mystics in his native state, who became known as the Society of Separatists. In 1817 he was chosen leader of the company of about 300 which emigrated to Amer-

ica and settled at Zoar, and until his death he exercised an almost autocratic control over them. Outside the community he was generally known as "King Bimeler," while his fellow Separatists were commonly called "Bimelers." He was at first opposed to the introduction of communism, but finally yielded to the wishes of his associates and was largely responsible for the successful working of the system. For 40 years he was both the spiritual and the temporal leader, and with his death the community began gradually to decline. A number of "discourses" delivered by him in 1832 were published under the title *Die wahre Separation, oder die Wiedergeburt, dargestellt in geistreichen und erbaulichen Versammlungs-Reden und Betrachtungen, besonders für das gegenwärtige Zeitalter anwendbar, gehalten in der Gemeinde in Zoar im Jahre 1832* (3 vols., Zoar, 1856), and subsequently formed the basis for a large part of the devotional exercises of the community, exercising an influence among them greater even than that of the Bible. See ZOAR COMMUNITY.

BAUMGARTEN, boum'gär-ten, ALEXANDER GOTTLIEB (1714-62). A German philosopher of the school of Wolff. He was born in Berlin and studied at Halle. In 1738 he became privat-docent at Halle, and in 1740 professor of philosophy at Frankfurt-on-the-Oder, where he died. His text-books in philosophy were much used, and Kant made them for a while the basis of his own lectures. The cleverness of his style made him an important contributor to modern philosophical terminology. Among other philosophic subjects he contributed an interesting work on aesthetics, but the claim often made that he is the founder of modern æsthetic theory cannot be granted unqualifiedly. His most important works were: *Metaphysica* (1739), reissued by Eberhard (1789); *Ethica Philosophica* (1740); *Æsthetica* (2 vols., 1750-58; left unfinished); *Philosophia Generalis* (ed. by Förster, 1770). Consult G. Meyer, *Leibniz und Baumgarten als Begründer der deutschen Ästhetik* (Halle, 1874), and J. Schmidt, *Leibniz und Baumgarten* (Halle, 1875).

BAUMGARTEN, HERMANN (1825-93). A German historian, born at Lesse (Brunswick). In 1842-48 he studied at Jena, Halle, Leipzig, Bonn, and Göttingen, and later at Heidelberg and Munich. In 1861-72 he was professor of history and literature at the Polytechnikum at Karlsruhe and in 1872-89 at the University of Strassburg. His publications include: *Geschichte Spaniens zur Zeit der französischen Revolution* (1861); *Geschichte Spaniens vom Ausbruch der französischen Revolution bis auf unsere Tage* (3 vols., 1865-71); *Karl V und die deutsche Reformation* (1889).

BAUMGARTEN, MICHAEL (1812-89). A German theologian, born in Haseldorf (Holstein). He studied at the University of Kiel, in 1846 became pastor at Schleswig, and in 1850 professor of theology at Rostock. Although admittedly orthodox in his views, he strongly opposed the Lutheran hierarchy and was in 1856 removed from the board of theological examiners and in 1858 deprived of his professorship. In 1865 he assisted in founding the Protestantenverein. The more important of his works are his *Die Nachtgeschichte Sacharias* (1858); *Apostelgeschichte* (2 vols., 2d ed., 1859); *Die Geschichte Jesu* (1859); *Schleiermacher als Theolog* (1862); *Zwölf kirchengeschichtliche Vorträge zur Beleuchtung der kirchenlichen*

Gegenwart (1869); *Kirchliche Zeitfragen in Vorträgen* (1873); *Doktor Martin Luther: ein Volksbuch* (1883). Consult his autobiography, edited by H. H. Studt (Kiel, 1891).

BAUMGARTEN-CRUSIUS, boum'gär-ten-kroō'zè-us, LUDWIG FRIEDRICH OTTO (1788-1843). A German theologian. He was born at Merseburg, July 31, 1788, and died at Jena, May 31, 1843. He studied theology at Leipzig and in 1810 became university preacher. In 1812 he was appointed professor extraordinary of theology at Jena, in 1817 full professor of theology, and always distinguished himself as a champion of religious liberty, on behalf of which he wrote various treatises. In 1820 appeared his *Introduction to the Study of Dogmatics* (Leipzig, 1820), a work of considerable originality and wealth of thought. More complete exhibitions of his opinions are to be found in his *Manual of Christian Ethics* (Leipzig, 1826), *Outlines of Biblical Theology* (Jena, 1828), and *Outlines of Protestant Dogmatics* (Jena, 1830). In 1831-32 he published a *Text-Book of the History of Doctrines*; in 1834, a work on *Schleiermacher, his Method of Thought and his Value*; and also *Considerations on Certain Writings of Lamennais*. After his death Kimmel published the whole of his exegetical prelections on the Gospels and Pauline Epistles, and H. Hase completed from his notes his *Compendium der christlichen Dogmengeschichte* (2 vols., Leipzig, 1840-46).

Baumgarten was conspicuous for the breadth and solidity of his learning, the originality of his spirit, and the acuteness of his understanding, but was nevertheless deficient in clear and vivid expression. He attached himself to no school, theological or philosophical. At an early period he had been greatly influenced by the metaphysics of Schelling, from which, however, he ultimately emancipated himself. His thinking was to a certain extent rationalistic, but was strongly modified by the influence of Schleiermacher.

BAUMGARTNER, boum'gärt-nër, ALEXANDER (1841-1910). A Swiss Jesuit writer, born at Saint-Gall. He entered the Jesuit order in 1860 and completed his theological studies at Münster, Maria-Laach, and Ditton (England). He then studied Scandinavian literature in Copenhagen and Stockholm. In several of his works he seeks to depreciate the German classicists. His writings of this character include *Goethe; sein Leben und seine Werke* (3 vols., 2d ed., 1885-86), *Goethe und Schiller* (1886), and *Der Alte von Weimar* (1886). He has also written a translation from the ancient Icelandic of Eysteinn Asgrímsson; a festival play on the Spanish poet, Calderon (1881); *Longfellow's Dichtungen* (1878); and *Geschichte der Weltliteratur* (6 vols., 1897-1911).

BAUMGARTNER, ANDREAS, BARON VON (1793-1865). An Austrian statesman and scientist. He was born at Friedberg, in Bohemia, and studied at the University of Vienna, where in 1823 he became professor of physics. While filling this office, he gave popular lectures on Sundays upon mechanics for artisans and operatives, which met with much approbation. A result of these lectures was his *Mechanik in ihrer Anwendung auf Künste und Gewerbe* (2d ed., Vienna, 1823) and his *Naturlehre* (Vienna, 1823). Ill health forced him to resign his professorship, and he was appointed director of the Imperial porcelain manufactories, and after-

ward superintendent of the Austrian tobacco manufactories. In the year 1846 the establishment of the electric telegraph was committed to him, and in the following year he was placed in charge of the construction of the Austrian railways. In 1848 he became Minister of Public Works; in May, 1851, he was appointed Minister of Commerce and in December of the same year Minister of Finance. In 1855 he was appointed president of the Austrian Academy of Sciences, of which he had been vice-president for a number of years, and in 1861 he was called to the House of Peers of the Reichsrath. He published, in 1862, *Chemie und Geschichte der Himmelskörper nach der Spektralanalyse*; in 1864, *Die mechanische Theorie der Wärme*. Consult Schröter, *Freiherr von Baumgartner, Eine Lebensskizze* (Vienna, 1886).

BAUMGARTNER, GALLUS JAKOB (1797-1869). A Swiss statesman and historian, born at Altstätten (canton of Saint-Gall). He studied at Freiburg and Vienna and was prominent in the political affairs of his canton, the revision of whose constitution he promoted. As a member of various representative bodies of the canton and the Confederation, he was a leader of the Liberals until 1841, when he occasioned much surprise by his alliance with the Ultramontane party. In 1857-60 he represented his canton in the Council of Estates. He founded in 1842 the *Neue Schweizer Zeitung*, and published several historical works, of which the most extensive and important is *Die Schweiz in ihren Kämpfen und Umgestaltungen von 1830-50* (4 vols., 1853-66). Consult A. Baumgartner, *Gallus Jakob Baumgartner und die neuere Staatsentwicklung der Schweiz* (Freiburg-im-Breisgau, 1892).

BAUMSTARK, boum'stärk, ANTON (1800-76). A German philologist, born at Sinzheim, Baden. He was professor of philology at the University of Freiburg from 1836 to 1871. He published an edition of Curtius Rufus (1829), of Caesar (1832), and an important work entitled *Urdeutsche Staatsaltertümer* (1873). Some of his writings appeared under the pseudonym of Hermann vom Busche.

BAUMSTARK, EDUARD (1807-89). A German political economist, brother of Anton. He was born at Sinzheim, Baden; was educated at the University of Heidelberg; became professor in an academy of agriculture and political science at Eldena in 1842, and in the following year was appointed its director. He was a delegate to the Prussian National Assembly of 1848, and in the following year was elected a member of the Upper House of that body. He was subsequently a Liberal member of the Prussian Upper House and of the North German Diet. His writings deal chiefly with political economy and include the following: *Kameralistische Enzyklopädie* (1835); *Grundgesetze der Volkswirtschaft*, a translation of Ricardo's celebrated work (1837; 2d ed., 1877); *Zur Geschichte der arbeitenden Klasse* (1853).

BAUR, bour, FERDINAND CHRISTIAN VON (1792-1860). A German theologian. He was born at Schmiden, near Stuttgart, June 21, 1792; studied theology in the Blaubeuren theological seminary from 1805 to 1809 and in the University of Tübingen from 1809 to 1817. In 1817 he became professor in the Seminary of Blaubeuren, where he gave the first indications of his abilities by publishing his *Symbolik und Mythologie oder die Naturreligion des Altertums*

(3 vols., Stuttgart, 1824-25), a work which indicates the influence of Schleiermacher over the author. In 1826 he was called to Tübingen, where he held the chair of Protestant theology. His whole life was consecrated to religious studies—the history of doctrines, the symbolism of the Church, and biblical exegesis. On account of the universality of his culture, the wonderful activity and fertility of his mind, his rare combination of speculative thought with solid knowledge, and that faculty of historic divination or insight which enabled him to draw decisive results from separate, obscure, and neglected data, he has been regarded by many in Germany as the most massive theological intellect since Schleiermacher. His method of investigating the progressive history of religious opinion was governed by the principles of Hegelian philosophy, and incurred the reproach of formalism. It was charged that he made dogmas develop themselves with a kind of abstract inevitable regularity from previous historical conditions, without allowing for immediate and extraordinary providences. His most important works in the history of doctrine are *Die christliche Gnosis oder die christliche Religionsphilosophie* (Tübingen, 1835), a work which makes the Christian Gnosis of the second and third centuries the starting point of a long series of religio-philosophical productions traceable uninterruptedly down through Middle-Age mysticism and theosophy to Schelling, Hegel, and Schleiermacher; *Die christliche Lehre von der Versöhnung* (Tübingen, 1838); and *Die christliche Lehr von der Dreieinigkeit und Menschwerdung Gottes* (Tübingen, 1841-43). In reply to Möhler, the celebrated Roman Catholic theologian, who had attacked the Protestant church, he wrote *Der Gegensatz des Katholicismus und Protestantismus* (Tübingen, 1836). Besides these works, based on a historical treatment of religion, to which class also belongs his *Lehrbuch der christlichen Dogmengeschichte* (Stuttgart, 1847), he published various critical treatises on parts of the New Testament; such as *Die Christuspartei in der korinthischen Gemeinde; der Gegensatz des Paulinischen und Petrinischen Christenthums; und Der Apostel Petrus in Rom* (1831)—a work in which the author endeavors to demonstrate the existence of deep-rooted differences in primitive Christianity, between a Petrine (Judaizing) and a Pauline (Gentile) party. His inquiries concerning the Gnosis led him to study minutely the pastoral epistles, the result of which study was *Die sogenannten Pastorallbriefe des Apostels Paulus* (Stuttgart, 1835), in which he combats the idea that St. Paul was their author, and refers them to the second century. Of a similar nature is his *Paulus, der Apostel Jesu Christi* (Stuttgart, 1845).

His work on the Gospel of John produced a startling effect, as up to Baur's time that Gospel had generally been held prior in date to the three synoptic Gospels, whereas Baur strove hard to show that it was of post-apostolic origin. In 1847 appeared his *Kritische Untersuchungen über die kanonischen Evangelien, ihr Verhältniss zu einander, ihren Ursprung und Charakter*. In 1851 he published *Das Markusevangelium nach seinem Ursprung und Charakter*. In this and other similar works Baur maintained that we must extend our notions of the time within which the canonical writings were composed to a period considerably post-apos-

tolie, which can only be determined approximately by a careful investigation of the motives which apparently actuated their authors. The chief characteristic, therefore, of the Tübingen school, as exhibited in the works of its founder, is the union of a subjective criticism with a strong conviction of the historic reality of the New Testament writings. He maintained that there were only four genuine Pauline epistles—Romans, 1 and 2 Corinthians, and Galatians. Baur died in Tübingen, Dec. 3, 1860. Of his writings there have appeared in English translation: *Paul, the Apostle of Jesus Christ* (2 vols., 1873-75); *The Church History of the First Three Centuries* (2 vols., London, 1878-79). For his biography, consult: *Worte der Erinnerung* (Tubingen, 1861); C. von Weizsäcker, *Ferdinand Christian Baur. Rede zur akademischen Feier seines 100. Geburtstages* (Stuttgart, 1892); also, in general, R. W. Mackay, *The Tübingen School and its Antecedents* (London, 1863); A. B. Bruce, *F. C. Baur and his Theory of the Origin of Christianity* (New York, 1886); Friedrich, *Ferdinand Christian Baur* (Gotha, 1902).

BAUR, GUSTAV ADOLF LUDWIG (1816-89). A German evangelical theologian, born at Hammelbach (Odenwald). He studied at the University of Giessen, was appointed professor there in 1847, and in 1870 became professor at Leipzig. His publications include: *Grundzüge der Homiletik* (1848); *Boetius und Dante* (1874); *Die vorchristliche Erziehung* (1884; vol. i, K. A. Schmid's *Geschichte der Erziehung*).

BAURE, bou'rá. A tribe of Arawakan stock living on the eastern slope of the Cordilleras, on the Rio de los Baures, a tributary of the Beni River, in the department of La Paz, Bolivia. About the year 1674 they were Christianized by Jesuit missionaries and gathered into mission villages, together with the Moxos (q.v.).

BAUSE, bou'ze, JOHANN FRIEDRICH (1738-1814). A German engraver. He was born at Halle. He studied with J. J. Haid at Augsburg, and came under the influence of J. G. Wille, whom he took as his model. He became a member of the Leipzig Academy of Art in 1766 and spent the rest of his life in that city except the last year, when he was at Weimar in friendly relations with Goethe. His principal strength lay in portrait engraving, of which he was regarded as the leading exponent in Germany, although his technique is now regarded as somewhat mechanical. He made more than 200 portraits of contemporary notables, including reigning princes, theologians, merchants, scholars, poets, and actors. Among the prominent names in this valuable collection are the following: Joseph II (1762); Peter I and Peter III, Czars of Russia (1786 and 1762, respectively); Catharine II of Russia (1762); Frederick II, King of Prussia (1759); and the authors Gellert, Lessing, Mendelssohn, Leibnitz, Kant, Winckelmann, and Hagedorn. A catalogue raisonné of his works was published by Keil (Leipzig, 1849).

BAUSMAN, bous'man, BENJAMIN (1824-1909). An American Reformed (German) clergyman, born at Lancaster, Pa. He graduated at Marshall College (1851) and at the Theological Seminary, Mercersburg, Pa. (1852). He became pastor at Reading, Pa., in 1863. His books include: *Sinai and Zion, travels* (1860); *Wayside Gleanings in Europe* (1878); *Bible Characters* (1893); edition of *Harbaugh's*

Harfe, a Volume of Poems in the Pennsylvania German Dialect (1870).

BAUTAIN, bó'tán', LOUIS EUGÈNE MARIE (1796-1867). A French theologian and philosophic writer. He was born in Paris and studied at the Ecole Normale Supérieure. At the age of 20 he was made professor at the College of Strassburg, and later held a professorship at the university of that city, but was suspended from office in 1822 on charges of heterodoxy. In 1848, however, he was made vicar-general of the Diocese of Paris, and five years later professor of theology at the Sorbonne. His best-known writings include: *Art of Extempore Speaking* (1858-78); *De l'enseignement de la philosophie en France au XIX^e siècle* (1833); *Philosophie du christianisme*, edited by Bonnechose (1835); *Psychologie expérimentale* (1839; a second edition under the title *L'esprit humain et ses facultés*, 1850); *Philosophie morale* (1842); *La liberté et la religion* (1848); *La morale de l'évangile comparée aux divers systèmes de morale* (1855); *La philosophie des lois au point de vue chrétien* (1860). Bautain held that divine revelation is the only possible criterion of truth on ethical subjects.

BAUTZEN, bout'sen, or **BAUDISSLIN**, bou'dé-sén (Wendish *Budyšin*, hut city, from Slav. *buda*, hut, tent, Eng. *booth*). The capital of the circle of the same name in the Kingdom of Saxony, situated on rising ground overlooking the river Spree, 35 miles by rail east-northeast of Dresden (Map: German Empire, F 3). Ancient walls and defenses are preserved and have been transformed into promenades. Among the religious edifices the most noteworthy is the cathedral of St. Peter, which is divided into two parts by a grating and is used by both Protestants and Roman Catholics. The castle of Ortenburg, often the residence of the kings of Bohemia, is now occupied by government offices. The city's affairs are administered by a municipal council of 24 members and an executive board of 7. (See GERMANY, *Local Government*.) There are numerous schools, three public libraries, several museums, and an art gallery. Manufacturing industries are flourishing and include the production of woolen and other textiles, leather, paper, beer, pottery, etc. There are also dye works, distilleries, and iron foundries, and an active trade. Bautzen is a place of considerable antiquity and was made a town under Otho I in the tenth century. It suffered greatly in the war with the Hussites and still more during the Thirty Years' War. It is celebrated as the place where Napoleon, with an army of 130,000 men, after an obstinate resistance, won a barren victory over 90,000 of the allied Russians and Prussians on May 20-21, 1813. The Allies lost in the two days 12,000 killed and wounded, in addition to 1500 taken prisoners. The French left 5000 dead upon the field and had over 15,000 wounded. Pop., 1900, 26,000; 1905, 29,371; 1910, 32,760.

BAUXITE, bōks'it (from *Baux*; see below). The most important ore of aluminum, a hydrate with a variable composition which may be represented by the formula $Al_2O_3 \cdot xH_2O$. It carries from 20 to 40 per cent aluminum and usually some iron and silica. The ore occurs in rounded grains, in pisolitic or clay-like masses. The grains usually show a concentric structure and a variable color from white to yellow, brown, or red. It is named from its occurrence at

Baux, in France, but it is also known from Styria and Carinthia, in Austria, and from Antrim, in Ireland. In the United States it occurs in a belt about 60 miles long, extending from northwestern Georgia into northeastern Alabama, and also in Arkansas, near Little Rock. The foreign deposits result from the chemical alteration of the aluminous silicates in igneous rocks; the American deposits are in part of the same origin and partly hot-spring formations. Those of Alabama and Georgia are basin shaped and are limited vertically to points between 900 and 950 feet above sea level. The composition of good-grade American ore is approximately as follows: Alumina, 57 to 62 per cent; ferric oxide, under 1 per cent; silica, 2.5 to 3 per cent; titanic acid, 3 to 4 per cent; water (combined), 20 to 30 per cent; moisture, retained mechanically, 2 to 4 per cent. While bauxite serves chiefly as an ore of aluminum, it is also employed in the manufacture of alum, in making alundum, and for lining basic converters and Siemens-Martin furnaces in the manufacture of steel. The principal production of bauxite is in Arkansas. The total output in the United States in 1911 was 155,618 long tons valued at \$750,649. Consult: Hayes, "Bauxite," *Sixteenth Annual Report United States Geological Survey*, part iii (Washington, 1895); *Mineral Industry*, vol. ii (New York, 1893); Branner, "The Bauxite Deposits of Arkansas," *Journal of Geology*, vol. v (Chicago, 1897). See also ALUM; ALUMINIUM.

BAVARIA (Ger. *Bayern*). A kingdom and one of the constituent states of the German Empire, the largest in area and population next to Prussia. The Grand Duchy of Hesse divides Bavaria into two unequal parts. The eastern part is bounded by Austria on the east and south, Saxony, the Thuringian States, and Hesse-Nassau, on the north, and Württemberg, Baden, and Hesse on the west. The western portion, or Rhine Palatinate, is situated between Baden, Prussia, Alsace-Lorraine, and Hesse, and occupies only one-thirteenth part of the entire kingdom. The following table gives the area of Bavaria and its population in 1900 and at the census of Dec. 21, 1910:

Govt districts	Sq. miles	Pop., 1900	Pop., 1910
Upper Bavaria	6,454	1,323,888	1,532,065
Lower Bavaria	4,148	678,192	724,331
Upper Palatinate	3,729	553,841	599,461
Upper Franconia	2,702	608,116	661,862
Middle Franconia	2,930	815,895	931,691
Lower Franconia	3,244	650,766	710,943
Swabia	3,797	713,681	789,853
Palatinate	2,289	831,678	937,085
Total	29,293	6,176,057	6,887,291

In 1816 the population was 3,607,000; in 1864, 4,775,000; in 1871, 4,863,450; in 1880, 5,284,778; in 1890, 5,594,982. The average annual increase from 1816 to 1864 was 0.58 per cent; from 1864 to 1910, 0.80 per cent; from 1900 to 1910, 1.09 per cent. At the 1911 census there were 3,379,580 males and 3,507,711 females, or 1038 females to each 1000 males. Of the total, Roman Catholics numbered 4,863,251 (70.61 per cent); evangelical Christians, 1,942,658 (28.21 per cent); other Christians, 13,963 (0.20 per cent); Jews, 55,065 (0.80 per cent). The larger cities are: Munich, the capital, with 596,467 inhabitants at the 1910 census; Nuremberg, 333,142; Augsburg, 102,487 (not including Pfersee, with

10,928 inhabitants, annexed Jan. 1, 1911); Würzburg, 84,496; Ludwigshafen-am-Rhein, 83,801; Fürth, 66,553; Kaiserslautern, 54,659; Regensburg (Ratisbon), 52,624; Bamberg, 48,063; Hof, 41,126; Pirmasens, 38,463; Bayreuth, 34,547.

Bavaria may be described as a true geographical unit, as almost all of its boundary lines are formed by mountain ranges which lie in a rectangle around its inner basin. On the south it takes in a part of the eastern Alps, which form the three mountain ranges of southern Bavaria; the Algäuer Alps; the Bavarian Alps, containing the highest summit of the German Empire, the Zugspitze (9725 feet); and the Salzburger Alps. Along the Bohemian frontier stretches the mountain range of Böhmerwald, with its offshoot, the Bayerischer Wald, running in a northwestern direction along the Danube. On the north rise the Fichtelgebirge, the Rhöngebirge, and in the northwest is the Spessart. The Franconian Jura traverses the west and centre. The interior of Bavaria is an elevated plateau, sloping toward the north, with a mean altitude of 1600 feet, and intersected in several directions by low hills. The largest mountain range in the Palatinate is the Hardt Mountains, which have an elevation of over 2200 feet.

Bavaria belongs mainly to the basin of the Danube, by which it is traversed through its entire width from west to east. The part of Bavaria south of the Danube is drained by the tributaries of that stream, the most important of which are the Iller, Lech, Isar, and Inn. The northern tributaries of the Danube in Bavaria are the Wörnitz, Altmühl, Naab, Regen, and Vils. The northwestern part of Bavaria is drained by the Main and its tributary the Regnitz. There are not a few lakes in the southern part of the kingdom, the most important of which are the Chiemsee, Starnbergersee, and Ammersee, besides several mountain lakes, the most famous of which is Königsee, noted for its beautiful scenery. The most important canal of Bavaria is the Ludwigskanal, which connects the Altmühl, a tributary of the Danube with the Main, a tributary of the Rhine, thereby serving as a connecting link between the North and the Black seas. Among the numerous mineral springs in Bavaria the most famous are those of Kissingen and Reichenhall.

Climate. The climate of Bavaria, although somewhat colder than that of the rest of Germany, is on the whole mild and salubrious. The average annual temperature ranges from about 49° F. in the valleys along the Danube, the Rhine, and the Main, to less than 44° F. in the mountainous regions, with very considerable fluctuations. The rainfall ranges from about 23.5 inches around the Hardt Mountains, in the centre of the Rhine Palatinate, to over 78 inches in the southern part of Bavaria proper.

Mineral Resources. The mineral deposits of Bavaria are of considerable variety, but not much mining is being done outside of coal and iron. The coal output in 1910 was 773,916 metric tons, valued at 9,556,000 marks; brown coal, 1,494,631 tons, 11,160,000 marks; iron ore, 305,335 tons, 2,596,000 marks; graphite, 7415 tons, 314,000 marks; rock salt, 1192 tons; common salt (from aqueous solution), 45,141 tons, 2,053,000 marks; other salt, 41,524 tons, 2,704,000 marks.

Agriculture. Agricultural production is of relatively greater importance in Bavaria than

in any other German state, and the soil has been brought to a degree of cultivation surpassed in only few countries. Threatened by the competition of new countries with a virgin soil and cheap land, the Bavarian landholder was compelled to adopt every available means in order to increase the productiveness of the soil. With this end in view numerous associations were formed in almost every department of agriculture. The buying of seeds and agricultural machinery, storing of grain, raising of domestic animals, marketing of agricultural products, insurance of farm buildings and crops, and numerous other operations are all carried on largely through cooperative societies. A considerable proportion of the landholders are in the habit of insuring their crops. In his struggle against foreign competition the Bavarian landholder has not been left entirely to his own efforts. The state has come to his assistance in offering him reduced rates on the transportation of agricultural products, machinery, and manure, in establishing agricultural banks, in improving the breed of domestic animals, and in opening agricultural schools. That all of these measures have helped to bring about a decided improvement in agricultural methods is shown by the enormous increase in the use of agricultural machinery in the last decades.

Of the total area in 1900, 3,047,300 hectares (or 40.2 per cent) were in cultivated field and garden; 1,296,700 hectares (17.1 per cent), meadow; 260,700 hectares (3.4 per cent), pasture; 24,900 hectares (0.3 per cent), vineyard; 2,466,600 hectares (32.5 per cent), forest; 490,900 hectares (6.5 per cent), roads, yards, water, etc. The areas devoted to leading crops in 1912 in hectares and the production in metric tons in 1912 and 1911 were as follows:

	Ha. 1912	Tons 1912	Tons 1911
Rye	567,189	929,644	764,852
Wheat . . .	290,375	489,785	431,397
Winter spelt . . .	61,653	89,503	89,594
Summer barley .	361,376	668,780	671,269
Oats	506,955	744,661	741,151
Potatoes	370,806	4,708,746	2,510,811
Hay	1,283,615	6,338,750	4,628,076
Hops	17,625	11,509	4,800

Other crops of importance are sugar beets, tobacco, and rape seed. Vine growing is an important industry, but shows no progress; it is confined almost entirely to the Palatinate and Lower Franconia. The following figures relate to 1911 and 1912 respectively: Productive area under vines, 20,570 and 20,650 hectares (12,202 and 15,328 in the Palatinate); yield of must, 713,511 and 575,301 hectoliters; value of must, 40,600,000 and 25,900,000 marks.

In 1892 there were 681,521 farms, and in 1907 669,911. The following figures are for 1895 and 1907 respectively: farms under two hectares, 236,575 (4.1 per cent of total farm area) and 241,642 (4.0 per cent); between two and five hectares, 165,408 (12.7) and 162,431 (12.9); between five and 20, 216,999 (49.5) and 224,640 (52.1); between 20 and 100, 44,182 (31.1) and 40,663 (29.8); 100 hectares and over, 621 (2.6) and 535 (2.2); total farms, 663,785 in 1895, comprising 4,341,577 hectares, and 669,911 in 1907, comprising 4,239,237 hectares.

In number of live stock Prussia stands first and Bavaria second among the German states. Stock breeding is conducted with great care and

intelligence, and state studs are maintained for improvement of the breed of horses. Live stock, December, 1912: horses, 400,300; mules and asses, 700; cattle, 3,554,000; sheep, 474,000; swine, 1,812,000; goats, 310,861; fowls, 10,319,000.

The woods and forests of Bavaria in 1900 covered an area of 2,466,600 hectares, or 32.5 per cent of the total area of the kingdom, of which 49 per cent belongs to private persons, 34 per cent to the state, and the remainder mostly to the communities. The annual income derived from the forests through the sale of timber and the rent of grazing land amounts to about \$10,000,000.

Manufactures. Bavaria is the largest per-capita beer-producing country in the world, and its beer has a world-wide fame. In 1911 its per-capita production was 283 liters, as compared with 178 for Württemberg, 149 for Baden, 79 for Alsace-Lorraine, and about 107 for all Germany. Bavaria's total beer production is almost two-sevenths that of the Empire; in 1911 it was 19,642,000 hectoliters (as compared with about 70,353,000 hectoliters in the Empire); in 1910, 18,110,000; in 1907, 18,641,000. The textile and metal industries are developed to a considerable extent. There are also some large tobacco factories, tanneries, and chemical works. Among other important industries is the manufacture of earthenware, glass, agricultural implements, machinery, leather goods, and wooden articles. There are many establishments devoted to the polygraphic processes.

Commerce and Transportation. Bavaria's foreign commerce is included in that of the German Customs Union. Its chief export is beer. In 1911 Bavarian railways aggregated 8216.4 kilometers (5105.4 miles), of which 8060.6 kilometers broad gauge and 155.8 narrow gauge. Of broad-gauge railway there were 106.2 kilometers per thousand square kilometers of territory and 116.4 kilometers per 100,000 inhabitants. Of broad-gauge railway 7818.7 kilometers were state lines, and 241.9 kilometers private. Of the narrow gauge 115.5 kilometers were state, and 40.3 private. The navigation on the Danube, the Main, and the Lake of Constance is very active.

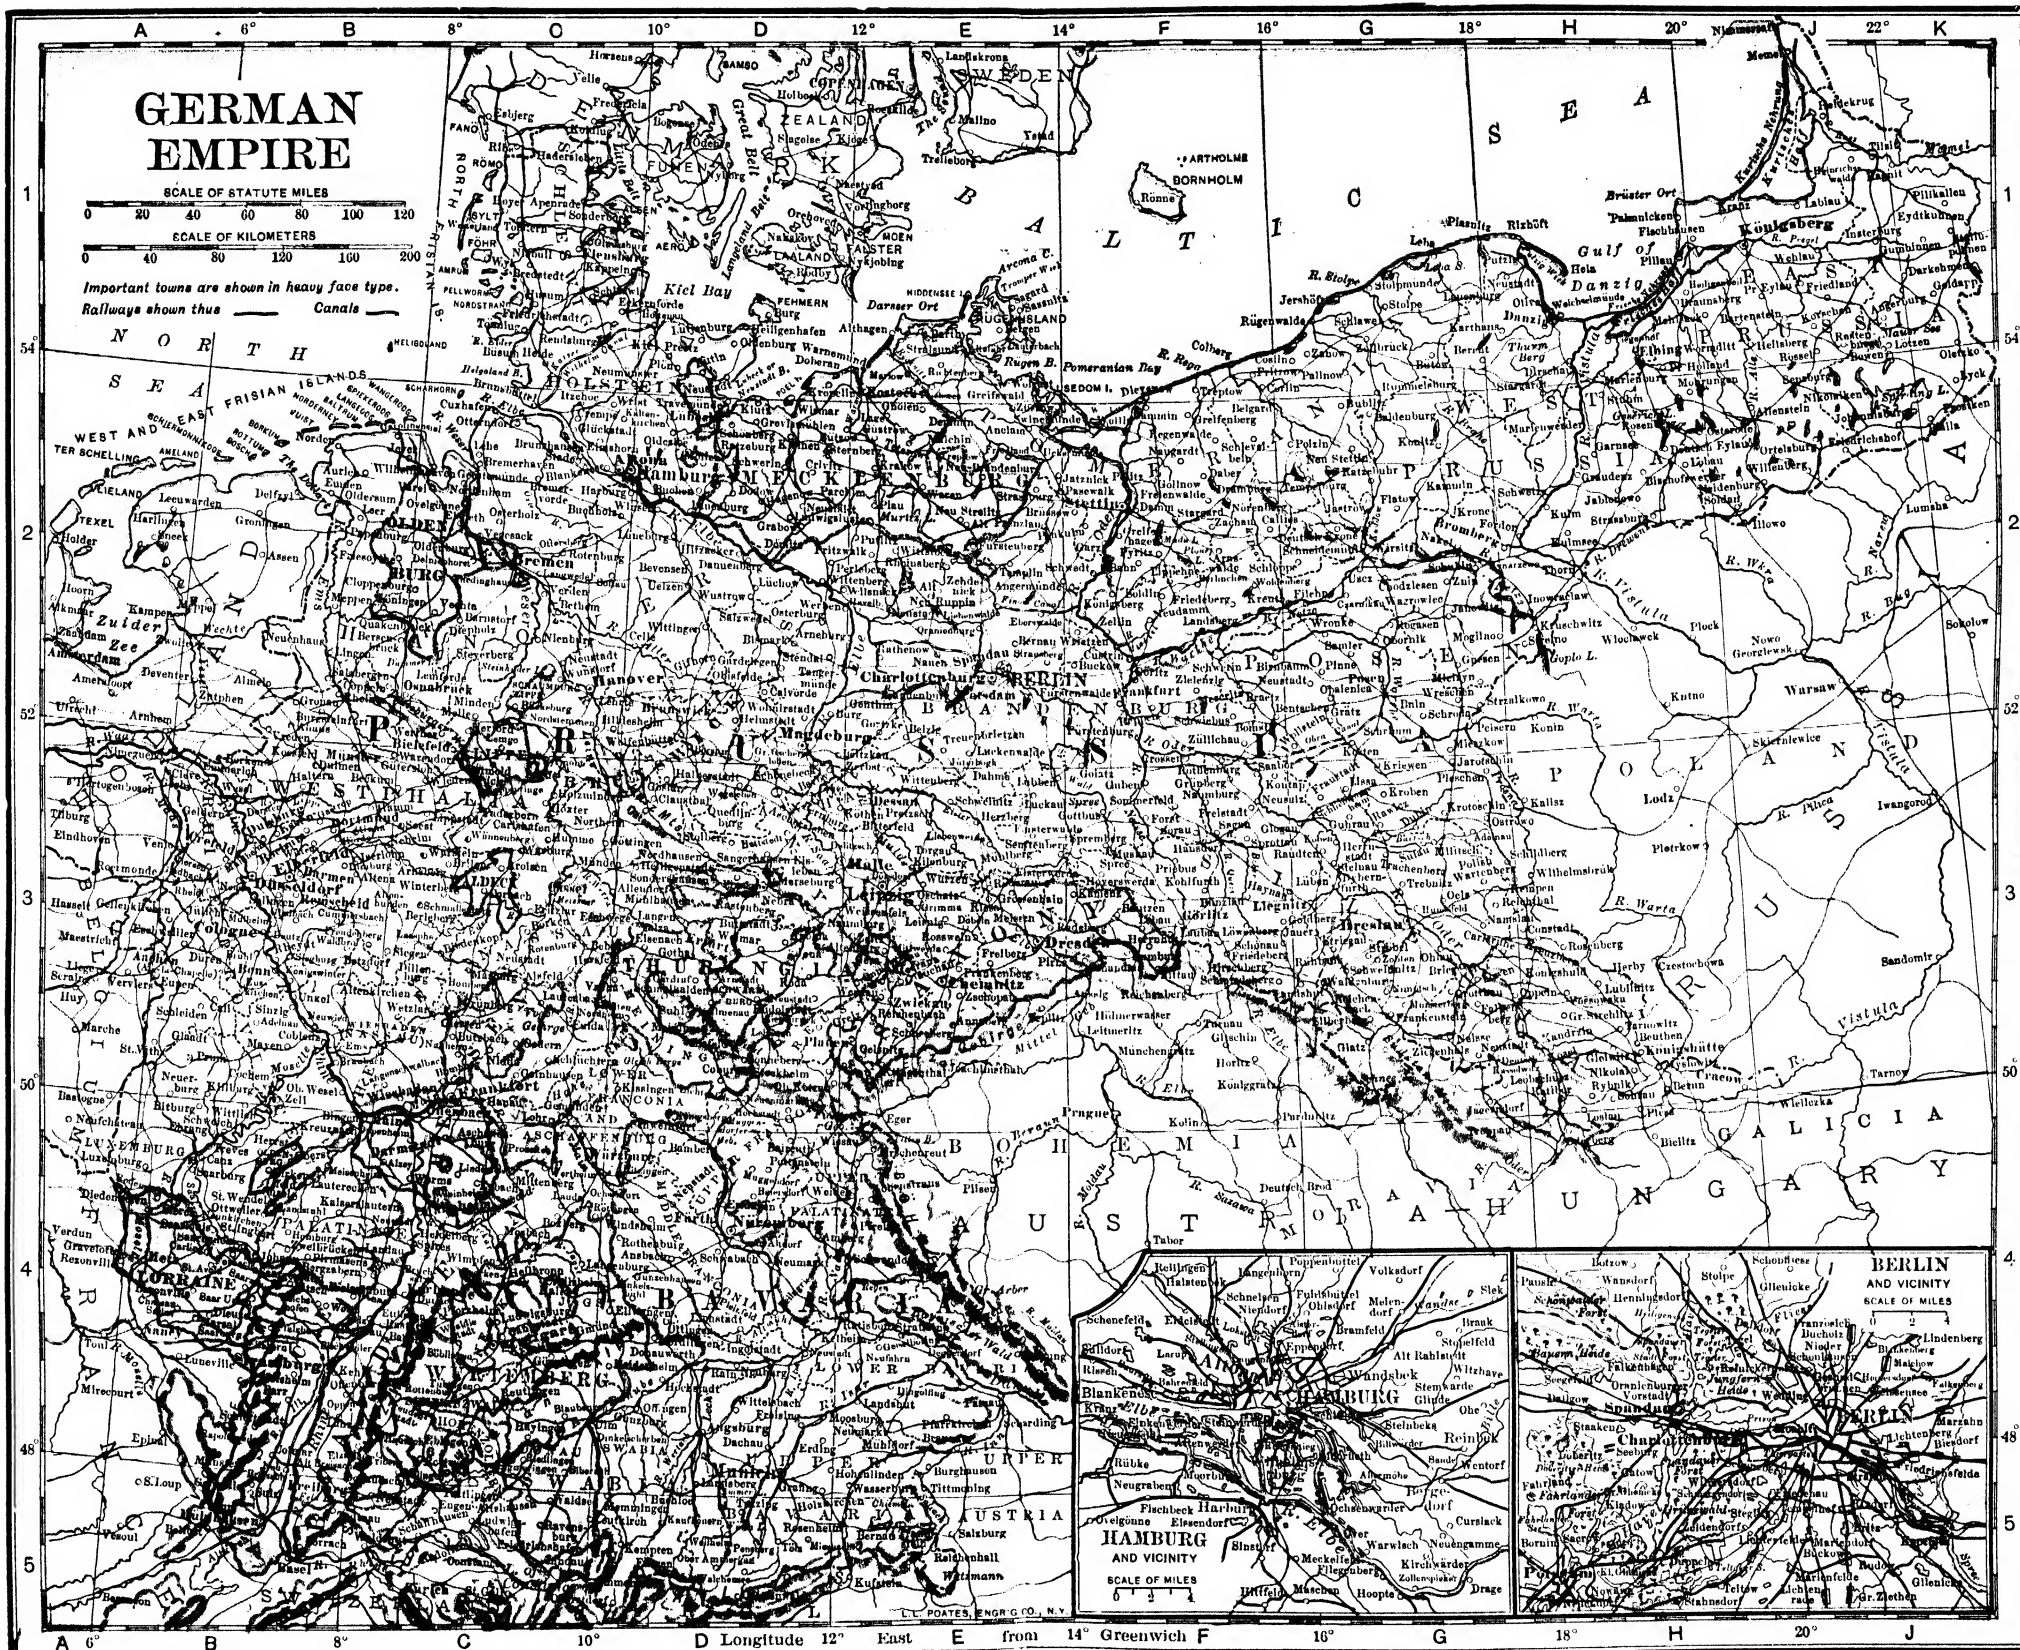

Government. Bavaria is a constitutional monarchy, the crown being hereditary by primogeniture in the male line or, if that fails, in the female line. The constitution of Bavaria bears date of May 26, 1818. It has been modified since. The kingdom, which entered the North German Confederation by treaty of Nov. 23, 1870, for the establishment of the German Empire, is independent in its internal affairs, having complete control of its army in time of peace, managing its own transportation and communication facilities, and collecting revenue for its separate budget. The executive power is vested in the King, who is assisted by a responsible ministry of seven members, and advised by a state council. The legislative power rests with the King and the Parliament (*Landtag*), which consists of two houses. The Upper House, or Chamber of Councilors of the Realm, consisted in 1913 of 18 princes of the royal family, 2 crown dignitaries, 2 archbishops, the heads of 17 noble families of the realm, 1 bishop, the president of the Protestant Chief Consistory, 32 hereditary members, and 18 persons appointed for life by the King; total, 91. The number of life members must not exceed one-third of the hereditary councilors. The president of the Upper House is

appointed by the King. The members of the Lower House, 163 in number, are elected for six years by direct vote. The voting franchise is restricted by a property qualification. The Chamber of Deputies elects its own president and vice president, and its sanction is necessary for almost every measure relating to the financial affairs of the realm. It enjoys the right of initiative to a considerable extent. In the Imperial *Bundesrat* Bavaria is represented by six members, and in the *Reichstag* by 48.

For purposes of local administration Bavaria is divided into eight government districts (*Regierungsbezirke*), subdivided into administrative districts. In every government district there is a *Landrat*, consisting of representatives of the districts, the towns, the landed nobility, the clergy, and the university, if there be one, all elected for six years.

The budget of Bavaria is fixed every two years. The budget for each of the years 1911 and 1912 balanced at 676,214,154 marks; for 1913, 691,930,633 marks; the latter figure shows that the budget doubled in 15 years. The revenue is derived mainly from public works, Imperial repayments, and indirect taxes. The public debt at the end of 1911 amounted to 2,427,281,578 marks, of which 1,913,315,200 marks, or about 79 per cent, was on account of the railways.

Education is free and compulsory, and provided for by the state in a generous manner. There are three universities (at Munich, Würzburg, and Erlangen) and a large number of secondary and special schools. In 1911 the public elementary schools numbered 7566, with 18,352 teachers (of whom 13,521 were male) and 1,041,676 pupils. There were 43 gymnasia, with 1146 teachers and 17,652 students. In the winter semester of 1912-13 the University of Munich had 7718 students; Würzburg, 1548; Erlangen, 1307.

History. The Celtic inhabitants of what now constitutes the southern part of Bavaria were conquered by the Romans about 15 B.C. The region was included partly in *Vindelicis* and partly in *Noricum*. The Romans founded the colonies of *Augusta Vindelicorum*, "Augusta of the *Vindelici*" (now Augsburg), *Regina Castra* (Regensburg or Ratisbon), and *Castra Batava* (Passau). At the time of the great migration of nations the Marcomanni, moving westward from their seats in Bohemia (*Boiohemum*, so named from the Celtic Boii, whom the Marcomanni had conquered about the beginning of the Christian Era), settled in Bavaria, which took its name from the new occupants, who were known as *Boiarii* (possessors of the country of the Boii). Dukes of the Bavarians appear in history as early as the sixth century. The bishoprics of Salzburg, Passau, Freising, and Ratisbon were founded or restored in the eighth century. Before the close of that century Bavaria had been brought completely under the sway of the Franks. After the extinction of the Carolingian dynasty, early in the tenth century, a new Duchy of Bavaria arose. In 1070 Bavaria passed into the possession of the Guelph (Welf) family. In 1180, when Henry the Lion was placed under the ban of the Empire by Frederick Barbarossa, his Bavarian territories were transferred to Otho, Count of Wittelsbach, whose descendant now occupies the royal throne. The Rhenish Palatinate was conferred on this family by the Emperor Frederick III in 1214. Louis of Bavaria was Emperor of Germany in 1314-47.

At this time the Palatine was separated from Bavaria. (See *PALATINATE*.) Duke Maximilian, for his services to the Imperial cause in the Thirty Years' War (q.v.), was raised to the dignity of Imperial Elector in 1623, and in 1628 was invested with the Upper Palatinate. In the War of the Spanish Succession Bavaria supported France. The Elector Charles Albert was one of the princes who sought to dismember the Austrian dominions on the accession of Maria Theresa. (See *AUSTRIAN SUCCESSION*, *WAR OF THE*.) He was elected Emperor of Germany in 1742, and died in 1745. In 1777 the Wittelsbach line in the Electorate of Bavaria became extinct, and the Wittelsbach line in the Rhine Palatinate succeeded to the throne. In 1805 Bavaria was erected into a kingdom by Napoleon I. The King assisted Napoleon in his wars and received large additions of territory. In 1813, however, he cleverly contrived to change sides and thus managed to have confirmed to him, by the treaties of 1814-15, an extent of territory nearly as valuable as the possessions which the treaties of Pressburg and Vienna had given him and which he had now to restore to Austria.

In 1818 the new constitution came into existence, but, owing to various causes, it did not secure the measure of popular freedom that had been expected. In 1825 Louis I ascended the throne. He was a well-meaning and liberal monarch, but he lavished the wealth of the kingdom on the embellishment of the capital and on works of art, while he neglected works of practical value. The revolutionary wave of 1830 produced some disquiet in the country, but no serious disturbance. The Bavarian government, however, took alarm, and restricted the freedom of the press; and, though the restrictions were speedily repealed, dissatisfaction was created by the imposition of new taxes. The Jesuits obtained great influence with the King, which they used to the detriment of popular rights. The people were further aroused by the King's relations with the notorious Lola Montez (q.v.), who was looked upon as an agent of the Ultramontanes. In March, 1848, following the example of the French revolutionists, the people of Munich seized the arsenal and demanded reform and the expulsion of Lola Montez. The King had to consent, but in the same month he abdicated. His son, Maximilian II, ascended the throne. He died in 1864, and was succeeded by Louis II, a distinguished patron of Wagner, the great musician. After 1850 Bavaria showed itself hostile to the national movement toward German unity under the leadership of Prussia. In the War of 1866 it sided with Austria against the former power, suffered defeat, and was compelled to cede nearly 300 square miles to Prussia and to enter into an offensive and defensive alliance with the victor. The country was forced by the power of national sentiment to join in the war against France. Circumstances thereafter made its entrance into the new German Empire inevitable. In June, 1866, Louis II, who had become insane, committed suicide. His brother assumed the title of Otho I; but this prince being also mentally incapable of governing, the regency was taken over by an uncle, Prince Luitpold, who ruled in behalf of the demented monarch till Dec. 12, 1912, when he was succeeded in the regency by his son Prince Ludwig Leopold. On Nov. 9, 1913, the regent, consenting to widespread popular demand, accepted the crown as Leopold III.

kunde des Königreichs Bayern (Munich, 1860-68); Geistbeck, *Das Königreich Bayern in geographisch-statistischer Beziehung* (ib., 1878); Wenz, *Vollskunde von Bayern* (Nuremberg, 1879-84); *Beiträge zur Landeskunde Bayerns* (Munich, 1884), containing a complete bibliography; Götz, *Geographisch-historisches Handbuch von Bayern* (Munich, 1895-98); Gumbel, *Geologie von Bayern* (Cassel, 1884-94); *Die Landwirtschaft in Bayerns* (Munich, 1890), a memorial prepared from official sources; Beck, *Bayerns Grossindustrie und Grosshandel* (Nuremberg, 1895); Piloty, *Die Verfassungskunde des Königreichs Bayerns* (Gotha, 1878-99); Heigel, *Die Wittelsbacher* (Munich, 1895); Riezler *Geschichte Bayerns* (Munich, 1880); Brechler, *Darstellung der geschichtlichen Entwicklung des bayerischen Staatsgebiets* (Berlin, 1890). See GERMANY.

BA'VIUS and **MÆ'VIUS**. Two Latin poetasters, who, otherwise unheard of, were made immortal bywords through their malevolence toward Horace and Vergil. Nothing further definite is authentically known of them, although they have unwarrantedly been credited with the *Antibucolica*, two pastoral parodies of the Vergilian *Eclogues*. By Vergil they are contemptuously dismissed with the well-known verse:

"Qui Bavius non odit, amet tua carmina, Mævi."
(*Ecl.* III, 90.)

Horace, however, in the Tenth Epode attacks Mævius in a tone of boisterous and half-burlesque exaggeration.

BAWBEE', or **BABEE**. The popular designation of a half-penny in Scotland, now dropping out of use. The origin of the term is obscure, but it is most probably a corruption of the French *bas billon* ("base bullion" or mixed metal), applicable to debased copper money. In the plural form the word is popularly used in Scotland to signify money generally.

BAX, ERNEST BELFORD (1854-). An English writer on Socialism, born at Leamington, England. Educated privately in London and in Germany, he made a special study of music, and later of philosophy, especially the German movement from Kant to Hegel. In 1880-81 he was engaged as a correspondent of English papers, but presently he decided to leave the Continent. Upon his return to England he became prominently identified with the early Socialist movement. In conjunction with William Morris (q.v.) he helped in 1885 to found the Socialist League, and for a time was editor, with Morris, of the weekly journal, *Commonweal*. Subsequently resigning from the league, he interested himself in the Social Democratic Federation, of whose organ, *Justice*, he was made editor. He attended various international congresses as a delegate from the federation. Among his journalistic activities is to be included the editing, for a period, of the Socialist monthlies, *Time* and *To-Day*. He wrote the following books on historical and economic subjects: *Jean-Paul Marat* (1878); *Handbook to the History of Philosophy* (1884); *Religion of Socialism* (1886); *French Revolution* (1890); *The Problem of Reality* (1898); *Socialism; Its Growth and Outcome*, with William Morris (1894); *Essays in Socialism, New and Old* (1906); *The Roots of Reality* (1907); *The Last Episode of the French Revolution* (1911); *Problems of Men, Mind, and Morals* (1912).

BAXTER, JAMES PHINNEY (1831-). An American historian, born at Gorham, Me. He had an academic education and became a prominent merchant and manufacturer in Portland, Me., of which city he was six times elected mayor. He organized the Associated Charities and was its first president. He was chosen president of the Maine Historical Society, edited ten volumes of the *Documentary History of Maine*, and published: *The Trelaiceny Papers* (1884); *George O'Leary and His Times* (1885); *The British Invasion from the North* (1887); *Sir Ferdinando Georges and his Province of Maine* (1890); *The Pioneers of New France in New England* (1894); *The Voyages of Jacques Cartier* (1906); and co-author of a *World Atlas of Christian Missions* (1911).

BAXTER, RICHARD (1615-91). An English Nonconformist divine, born Nov. 12, 1615, at Rowton, near Shrewsbury, Shropshire. He was privately and none too well educated and in 1633 went to court with an introduction to the master of the revels. A month convinced him that he was out of his element at Whitehall, and an illness after his return deepened the earnestness of his religious convictions. He studied theology, was ordained (1638), became master of the Dudley grammar school, and then assistant to a clergyman at Bridgnorth, and in 1640 was chosen parish clergyman of Kidderminster. There he established a reputation as one of the most remarkable preachers of his time and effected a wonderful improvement in the manners of the people. On the breaking out of the Civil War his position was peculiar. His religious sympathies were almost wholly with the Puritans, his political with the monarchy, and, though a Presbyterian in principle, he was far from admitting the unlawfulness of episcopacy. The open respect he showed to some leading Puritans exposed him to danger from the mob. He retired to Coventry, where he ministered for two years to the garrison and inhabitants. He afterward accepted the office of chaplain to Colonel Whalley's regiment and was even present at the sieges of Bridgewater, Exeter, Bristol, and Worcester. He was in the army hoping to modify the intolerance of partisanship, and to promote "the spirit of love and of a sound mind." When ill health forced him to leave the army, he returned to Kidderminster and continued to labor there for some time. At this time he wrote *Saints' Rest* and *Call to the Unconverted*. He never dissembled his sentiments with regard to the execution of the King and the usurpation of Cromwell, even in the presence of the Protector. On the return of Charles, Baxter was appointed one of his chaplains (1660) and took a leading part in the conference held at the Savoy to reconcile the contending church factions, a project defeated by the bigoted obstinacy of the bishops. The see of Hereford was offered to him but he declined and asked to be permitted to return to Kidderminster. His request was refused. The Act of Uniformity at length drove him out of the Anglican church, and in July, 1662, he retired to Acton, in Middlesex, where he spent the greater part of nine years, chiefly occupied in writing. The Act of Indulgence in 1672 permitted him to return to London. In 1685 Judge Jeffreys condemned him, for "sedition" in his *Paraphrase of the New Testament*, published in that year, to pay a fine of 500 marks, and in default, to the King's Bench Prison. The trial is described by Macaulay in his history. After 18 months Bax-

ter was released and the fine remitted. After this he preached frequently without molestation. He died in London on Dec. 8, 1691.

Baxter is said to have preached more sermons, engaged in more controversies, and written more books than any other Nonconformist of his age; and Dr. Isaac Barrow said that "his practical writings were never mended, and his controversial seldom confuted." The total number of his publications exceeded 160. By far the most popular are his *Saints' Everlasting Rest* (London, 1650), only read now in an abridgment of an abridgment; *Dying Thoughts* (1683), and *Call to the Unconverted* (1657)—20,000 copies of which were sold in a twelvemonth, and which was translated into all European languages. His important theological writings are *Methodus Theologiae Christianae* (1681) and *Catholic Theology* (1675), in which his peculiar system (see BAXTERIANS)—a compromise between Arminius and Calvin—is embodied. He had long controversies with John Owen (q.v.), a rigid Calvinist, and with William Penn—for all his breadth of vision he had no sympathy with the Quakers. Some of his devotional poems are still used in some hymnals. His autobiographical narrative is historically valuable; the review of his religious opinions Coleridge called one of the most remarkable pieces of writing in religious literature. His *Practical Works*, in 23 volumes, with a biography by Orme, were published (London, 1830), and reprinted in 2 volumes, with life, by L. Bacon (New Haven, 1844); also in 4 volumes, with an introductory essay by Rogers (London, 1868). Consult: biographies by Orme (London, 1830), J. Stalker (1882), Boyle (1883), J. H. Davies (1887); the autobiography, *Reliquiae Baxterianae*, edited by Sylvester (1696), and by Jayne (London, 1910); an essay by Sir James Stephen in the second volume of his collected *Essays* (new ed., New York, 1907); Currier, *Nine Great Preachers* (Boston, 1913).

BAXTER, ROBERT DUDLEY (1827-75). An English political economist, born at Doncaster, Yorkshire, and educated at Trinity College, Cambridge. He became a member of the Statistical Society of London in 1866, in which capacity he wrote the following valuable contributions to economic statistics: *Railway Extension and its Results* (1866); *National Income of the United Kingdom* (1868); *Taxation of the United Kingdom* (1869); *National Debts of the Various States of the World* (1871); *Political Progress of the Working Classes* (1871).

BAXTER, SYLVESTER (1850-). An American publicist and writer. He was born in West Yarmouth, Mass., and received his academic education at Leipzig and Berlin (1875-77). Upon his return from abroad he took up newspaper work in Boston, subsequently serving as editor of the *Mexican Financier* (1883-84) and of the *Outing Magazine* (1885-86). He acted as special correspondent for several newspapers and magazines, in Mexico in 1883-84 and in South America in 1906. He first suggested the organization of Greater Boston and of a metropolitan park system for that city, and subsequently he became closely identified with the carrying out of these projects. In addition to numerous short stories, poems, and essays in magazines, his writings include: *The Old New World: Statement of the Hemenway Southwest-ern Archaeological Expedition* (1888); *Berlin: A Study in Municipal Government* (1890); *Cruise of a Land Yacht* (1891); *Greater Bos-*

ton (1891); *Spanish Colonial Architecture in Mexico* (1902); *Quest of the Holy Grail* (1904); *Old Marblehead* (1906).

BAXTERIANS. The term formerly applied to those who adhered to Richard Baxter's theological system, the peculiar doctrines of which were: first, that though Christ died in a special sense for the elect, yet he also died in a general sense for all; second, the rejection of the dogma of reprobation; third, that it is possible even for saints to fall away from saving grace. Baxter's views tended toward a liberal theology, but they are deficient in logical development. Like those of the "New England Theology" (q.v.), they occupied middle ground between what were considered the hard conclusions of Calvinism and the latitudinarian views of Arminianism. The two most eminent Baxterians were Dr. Isaac Watts and Dr. Philip Doddridge.

BAY (origin obscure; cf. LL. *basia*, bay). A term properly applied to an indentation of the sea into the land, with an opening wider than the depth. A gulf is understood to be deeper than a bay and has often a narrow opening. These terms are often loosely applied; Baffin Bay, e.g., is really a gulf. When the body of water is large, and the entrance narrow, it becomes a shut sea, as the Baltic, the Red Sea, etc. Hudson's Bay, the Persian Gulf, and the Gulf of Mexico might with propriety be termed seas.

BAY (OF. and Fr. *baie*, berry, from Lat. *baca*, berry). A name given to a number of trees and shrubs more or less resembling the laurel or victor's laurel (*Laurus nobilis*), which is also called sweet bay (see LAUREL), the name "bay," which was once exclusively applied to the fruit, having been extended to the whole plant. The common laurel or cherry laurel (*Prunus laurocerasus*) is sometimes called bay laurel. (See LAUREL.) The red bay of the Southern States of America is *Persca carolinensis*. The white bay, of sweet bay of America, is *Magnolia glauca* (see MAGNOLIA), and the lobolly bay of the same country is *Gordonia lasianthus*. (See GORDONIA.) The California bay tree is *Umbellularia californica*. Rosebay is a name sometimes applied to some of the evergreen rhododendrons. From early times bay leaves have been associated with popular superstitions and usages. Along with other evergreens, they have adorned houses and churches at Christmas; and in token of rejoicing or of some meritorious deed, sprigs of bay, as well as of laurel, have been worn in the hat or wreathed around the head. The leaves of some kinds of bay are employed for flavoring various articles of food.

BAY (OF. *bayer*, to gape, from ML. *badare*, to gape). In architecture, one division or unit in a structure, from top to bottom, including a main opening. In the interior of a Gothic church, for instance, a bay is a single pier arch of the nave or choir, with the corresponding part of triforium and clerestory above it; a section of the church bounded by two imaginary vertical lines from roof to pavement, passing through the centres of the supporting piers. A church has as many bays as it has pier arches. So in secular architecture, the voids being generally repeated over voids and solids over solids, a bay is a slice of the exterior (or interior) from top to bottom, from the centre of one solid to the centre of the next, taking in one window or opening in each story. A façade has as many

bays as there are of these vertical slices or repeats from end to end of the building.

BAYA, bā'yā (native name), or **BAYA SPARROW**. An East Indian weaver bird (*Ploceus baya* or *philippina*), remarkable for its tubular hanging nest. In India and Malaya this bird is familiar about village houses, is often kept in confinement or even as a free pet, and is trained to do a variety of tricks and especially to find small articles, steal ornaments from the hair, carry notes to certain places, etc. See **WEAVER BIRD**.

BAYAD, bā-yād'. A large edible catfish (*Bagrus bayad*) of the Nile.

BAYADERE, bā'yā-dēr', or **BAYADEER** (from the Port. *bailadeiria*, through the Fr. *bayadère*, danseuse, dancing girl; cf. It. *ballettare*, to dance, Eng. *ballet*). A name frequently used by Europeans to denote the dancing girls and singers of India. The title is especially applied to the women connected with the temples of southern India as opposed to the Nautch girls of northern India. As ministrants at the temples the Indian dancing women correspond in general to the *ἱερόδουλοι*, or *hierodouloi*, the girls in attendance upon the shrine of Aphrodite or Venus, at Corinth, in ancient Greece. In southern India these dancing girls are known as *Deva-dāsīs*, servants or slaves of the gods, and their office is to minister to the particular divinity to whom the temple may be sacred; to serve him and his priests at sacred festivals and solemn processions; to celebrate his glories and to weave the wreaths with which his image is decorated; to dance and sing twice a day before his idol at the shrine; and generally to perform subordinate duties in the temple, without participating in the celebration of certain of the most sacred rites, and to serve the priests in various ways. Although these dancing women are the servants of the gods, the public is said to call them by the more vulgar name of courtesans or prostitutes, whether they be for the enjoyment of the idols, or the Brahmans, or the benefactors of the sanctuaries. Hence, no doubt, comes the bad association connected with the designation "woman of the bayadere stripe." The ranks of the better class of these female ministrants at the temple are recruited, it is said, from the Vaiśya, or merchant caste; the inferior class from the families of Sudras, or working people. No strong social prejudice, however, is felt against their calling. A small but fixed salary is paid to them for their services in connection with the temple, and this stipend they supplement, it is understood, in various ways peculiar to their person and their profession. The higher class of bayaderes are often called in to perform at banquets, marriages, or at entertainments of the rich or the noble. Dancing in India is still confined to these professional girls, and is not considered respectable, although with the advance of female education women are now more generally taught to sing as well as to read. The special patroness or protectress of the Deva-dāsīs is the goddess Rāmbhā, who belongs to the band of Apsarases, or heavenly nymphs, of Indra's paradise. Consult Dubois, *Hindu Manners, Customs, and Ceremonies* (Oxford, 1897). See **NAUTCH**.

BAYAMO, bā-yā'mō. An inland town in the province of Oriente, Cuba, 60 miles northwest of the city of Santiago (Map: Cuba, J 6). It is situated in a plain on the Rio Bayamo, an affluent of the Cauto, and is an agricultural and

commercial centre, though formerly its importance was much greater. One of the oldest cities on the island, Bayamo, was founded in 1514 by Velasquez. It was prominent in the Republican uprising of 1868, and was one of the strongholds of the insurgents. Pop., 1899, 3022; 1907, 4102.

BAYAMON, bā'yā-mōn'. A town of Porto Rico, 6 miles (direct) southwest of San Juan (Map: Porto Rico, E 2). It is on the American Railroad and is an industrial centre, having sugar mills, match and tobacco factories, manufactories of ice and bricks, an iron foundry, and an oil refinery. The region abounds in grazing land, and sugar cane and fruit are grown. The town is well built and has a public school, a college, and several churches. Pop., 1899, town, 2218; municipality, 19,940; 1910, town, 5272; municipality, 29,986. Within the district of Bayamon are the ruins of Pueblo Viejo, the oldest Spanish settlement on the island. They are the remains of Caparra, a town reputed to have been founded in 1509 by Ponce de Leon.

BAYARD, bā'yär', Fr. pron. bā'yär'. The horse of the four sons of Aynlon, famous for his swiftness and for his power of adjusting the length of his body to one or several riders. He appears in *Orlando Innamorato*, *Orlando Furioso*, and Tasso's *Rinaldo*. On St. John's Eve, according to the legend, the clatter of his hoofs may still be heard over the hills of the Ardennes. The name "Bayard" is used to designate any spirited or fine horse.

BAYARD, bā'yär', GEORGE DASHIELL (1835-62). An American soldier, born at Seneca Falls, N. Y. He graduated at West Point in 1856 and passed four years in garrison duty on the frontier. At the outbreak of the Civil War he was appointed colonel of the First Pennsylvania Cavalry Volunteers. He was soon promoted to be brigadier general, served in the campaigns of the Shenandoah and the Rappahannock, and was mortally wounded at Fredericksburg (Dec. 13, 1862).

BAYARD, JAMES ASHETON (1767-1815). An American statesman, born in Philadelphia, Pa. He graduated in 1784 at Princeton, began the practice of law in Delaware, and in 1796 was elected to the national House of Representatives, where he achieved a high reputation as an orator and a leader of the Federalists. When, after the indecisive presidential contest of 1800 between Jefferson and Burr, the duty of election devolved upon the House, Bayard was prominent in securing the choice of the former. From 1805 to 1813 he was a United States Senator. In 1814 he was a member of the commission which negotiated with Great Britain the Treaty of Ghent.

BAYARD, JAMES ASHETON (1799-1880). A distinguished American constitutional lawyer and statesman, son of James Asheton Bayard and father of Thomas F. Bayard (q.v.). He was born in Wilmington, Del., studied law, and attained considerable eminence at the bar. He served in the United States Senate as a Democrat during the years 1851-64 and 1867-69, for a considerable part of which time he was chairman of the judiciary committee.

BAYARD, bā'yär', JEAN FRANÇOIS ALFRED (1796-1853). A French dramatist. He was born at Charolles, Saône-et-Loire, and studied law, but in 1828 turned to dramatic composition. In collaboration with Scribe and others he wrote more than 200 plays, including *La perle des*

maris and *Le gamin de Paris*. His collected works appeared in 12 vols. (1855-59).

BAYARD, bi'êrd, JOHN (1738-1807). An American patriot, born at Bohemia Manor, Md. He became a prominent merchant of Philadelphia, was a member of the provincial congresses of 1774 and 1775; in 1776 was appointed by the Constitutional Convention a member of the Council of Safety, and in 1776-77 served in the American army as colonel of infantry. He was Speaker of the Pennsylvania House of Assembly in 1777 and 1778, and was elected in 1785 to the Continental Congress. During the Revolution he assisted in furnishing arms to Congress and in fitting out a privateer.

BAYARD, bâ'yâr', PIERRE DU TERRAIL (1476-1524). A French knight, the *chevalier sans peur et sans reproche*, without a rival the model of chivalric virtue, and one of the few mediæval knights whose virtues can stand the tests of modern culture. Though his activity was chiefly military, he cultivated all the gentler virtues, yet was equaled by none in courage and intrepidity. Three French kings profited by his loyal devotion—Charles VIII, Louis XII, and Francis I. Italians, Spaniards, and Englishmen on innumerable occasions suffered by his remarkable exploits, but they honored as much as they feared him. At the Garigliano (1503) Bayard defended the bridge alone, against a whole detachment of the victorious army of Gonsalvo de Cordova. At Guinegate, in the "Battle of the Spurs" (1513) he performed an equal feat of valor. At Marignano (1515) Bayard gained a brilliant victory over the Swiss auxiliaries of the Duke of Milan. Upon the battlefield, his elated King (Francis I) bowed to receive knighthood from the hero of this "Battle of the Giants." In 1521 Bayard defended Mézières against Charles V, prevented an invasion which France could hardly have resisted, and on his return to Paris was hailed as the savior of his country. He was given command, in his own name, of a company of 100 knights—an honor usually accorded only to princes of the royal blood. He fell in the battle of the Sesia, April 30, 1524. While dying he fell into the hands of the Spaniards, among whom was the Constable of Bourbon, his last utterance to whom has become famous: "My lord, I thank you; but pity is not for me, who die a true man, serving my King; pity is for you, who bear arms against your prince, your country, and your oath." The Spanish vied with the French in the honors paid to his remains and his memory. His life was written soon after by Symphorien Champier, his "loyal servant." Consult St. Alban, Berville, and others, *Le Chevalier Bayard*, trans. and ed. by E. Walford (London, 1867).

BAYARD, bi'êrd, THOMAS FRANCIS (1828-98). An American statesman and diplomatist. He was born on Oct. 9, 1828, in Wilmington, Del., attended a private school in Flushing, L. I., and for some time was a clerk in a New York commercial house, but returned to Wilmington (1848), studied law with his father (J. A. Bayard), and was admitted to the bar in 1851. In 1861 both he and his father, though strongly opposed to secession, were also opposed to coercion, and publicly denounced the war, in which neither took any part. In 1869 he succeeded his father as United States Senator, being the fifth member of the family to represent Delaware in this capacity, and served continu-

ously until 1885, when he became Secretary of State under President Cleveland. In the Senate he took a leading position on the Democratic side; he was a member of the Electoral Commission in 1877, and was President pro tem. of the Senate in 1881. His name was often urged for the presidency, and in the Democratic national conventions of 1880 and 1884 he was the chief rival of the successful candidates. As Secretary of State he was called upon to deal with several important matters, such as the Bering Sea controversy and the British and Russian treaties. From 1893 to 1897 he was United States Ambassador to Great Britain, being the first to hold that diplomatic rank. While holding this office he was considered by some to have become too partial to English ways. For uttering some criticisms regarded as unfavorable to the United States the House of Representatives passed a vote of censure on him on Nov. 7, 1895. He received the degree of LL.D. from Harvard, and honorary degrees from both Oxford and Cambridge. Consult Edward Spencer, *Public Life and Services of Thomas F. Bayard* (New York, 1880).

BAYAZID, bâ'yâ-zêd', I. See BAJAZET.

BAYBAY, bi'bi'. A town of Leyte, Philippines, 40 miles from Tacloban, the capital of the province (Map: Philippine Islands, E 5). The town is a centre for coast trade and an important hemp port. Pop., 1903, 22,990.

BAY'BER'RY. See CANDLEBERRY.

BAY CITY'. A city and the county-seat of Bay Co., Mich., 108 miles north of Detroit on the Saginaw River, at the head of navigation, and on the Michigan Central, the Pere Marquette, the Detroit and Mackinac, the Detroit, Bay City, and Western, and the Grand Trunk railroads (Map: Michigan, F 5). It is connected also by boat with other lake ports. Several bridges cross the river at this place, and the city contains parks, two public libraries, a handsome Masonic Temple, a State Armory, and fine city hall. There is a large trade in lumber, salt, beet sugar, chicory, alcohol, coal, machinery, etc. Industries include shipbuilding and the manufacture of railroad wrecking cranes, etc. The distilling and fishing interests are also important. Settled in 1836, Bay City was incorporated as a village in 1859, and in 1865 was chartered as a city. In 1905 Bay City and West Bay City were consolidated. The water works and electric light plant are owned by the municipality. Pop., 1910, 45,166.

BAY CITY. A town and the county-seat of Matagorda Co., Tex., about 25 miles from the Gulf of Mexico, 86 miles southwest of Houston, on the Colorado River, near the Intercoastal Canal; and on the Gulf, Colorado, and Santa Fe, the St. Louis, Brownsville, and Mexico, and the Galveston, Harrisburg, and San Antonio railroads (Map: Texas, E 5). The chief industries are cotton ginning, rice milling, and the manufacture of ice and dairy products. The city is in a rich agricultural region, producing cotton, corn, rice, sugar cane, and a great variety of fruit. Bay City was founded about 1895, at which time it was made the county-seat. Its growth has been rapid. Pop., 1900, 473; 1910, 3156.

BAYER, bi'êr, JOHANN (1572-1660). A German astronomer. He was a zealous Protestant pastor and obtained the cognomen *Os Protestant-*

tium ('the Mouth of Protestants'). He is now remembered chiefly for his *Uranometria* (1603), in which he gave 51 maps of the heavens, constructed from the observations of his predecessors, and followed by explanations in his *Explicatio Characterum Aeneis Tabulis Insculptorum* (1654). In the former work he outlined 60 constellations, including, in addition to the 48 ancient constellations known to Ptolemy, 12 situated in the Southern Hemisphere and due chiefly to Petrus Theodorus of Embden, who died in 1596. He introduced in his maps the plan of distinguishing the stars of a constellation by means of Greek and Latin characters designating the largest star of the constellation by the first letter of the alphabet, and the rest in order of their apparent brilliancy by the succeeding letters.

BAYER, KARL ROBERT EMMERICH VON (1835-1902). An Austrian novelist, whose pseudonym was Robert Byr; born at Bregenz and educated at the military academy of Wiener-Neustadt. He served as an officer of the General Staff in the Italian campaign in 1859, but resigned from the military service in 1862 and thenceforth devoted himself exclusively to the writing of fiction, especially novels of military life. Among his best productions are the following: *Der Kampf ums Dasein* (5 vols., 1869; 2d ed., 1872); *Gita* (4 vols., 1877); *Eine geheime Depesche* (1880); *Unversöhnlich* (1882); *Lydia* (1885); *Der Weg zum Glück* (1890); *Sternschnuppen* (1897).

BAYES, bāz. A caricature of Dryden in Buckingham's play, *The Rehearsal*. The character is a would-be literary man and was at first meant to satirize Sir Robert Howard. The drama abounds in ridiculous situations, and the laureate's mannerisms are excellently shown.

BAYEUX, bā'yē' (city of the Baiocasses; *Baioca* in the Middle Ages). An episcopal city of France, in the department of Calvados, Normandy. It stands in the fertile valley of the Aure, about 5 miles above its outlet in the English Channel (Map: France, N., E 3). This ancient, badly built town has a fine cathedral; its splendid portal and three towers are conspicuous features of the place. The public institutions are a seminary, a communal college, a library of 30,000 volumes, and a museum, whose most curious historic relic is the famous tapestry by Matilda, Queen of William the Conqueror, which depicts the invasion of England. The industries of Bayeux comprise the manufacture of porcelain, lace, leather goods, and cotton. There is a brisk trade in farm products. Pop., 1901, 7312; 1906, 7736; 1911, 7638. Bayeux occupies the site of that Roman Augustodurum which took the place of the ancient capital of the Gallis Baiocasses. The position exposed to all the storms which swept over France from the conquest of Rollo to the great Revolution, during which it remained loyal to the Bourbons. Consult: Masselin, *Le diocèse de Bayeux du Ier au XIe siècle* (Caen, 1898), and Hepworth, "Bayeux," in *The Artist*, No. xxii (New York, 1898).

BAYEUX TAPESTRY. The most remarkable and extensive remaining specimen of early mediæval embroidery (q.v.). It is a web of white canvas or linen cloth, 214 feet long by 20 inches wide, preserved in the public library at Bayeux, France (Normandy). Upon it is em-

broidered, in woolen thread of various colors, a representation of the invasion and conquest of England by the Normans in 1066. Tradition asserts it to be the work of Matilda, wife of William the Conqueror; but it was made for Odo, Bishop of Bayeux, for his cathedral, where it was used as a decorative hanging on feast days. It contains 1512 figures in 72 subjects, with Latin inscriptions giving the subjects and names. The heads and hands of the figures are crudely designed in "plumetis"; the rest is formed of parallel lines of woolen threads fastened down at intervals. A thread of a different shade gives the outlines. The border is of foliage, fantastic animals, and hunting scenes. The tapestry is most valuable for a representation of the costume, arms, and manners of the Normans before the Conquest, and does for this period what the columns of Trajan and Marcus Aurelius do for Roman military life in their age; giving also, as they do, more details of the events represented than are given in contemporary literature. It is, in fact, more than a history of the Conquest; for it gives the life of Harold, even during the lifetime of Edward the Confessor, the incidents of his journey to Normandy, his return and coronation, the Norman expedition, the battle of Hastings, and Harold's death. Reproductions in autotype have been edited by Fowke (London, 1875), and in color by Stothard, *Vetusta Monumenta*, vol. vi, part i. Consult Freeman, *History of the Norman Conquest* (London, 1875), vol. iv. Consult also the monographs by Fowke (ib., 1898) and Marignan (Paris, 1892).

BAYEZID. See BAJAZET.

BAY LAUREL. See CHERRY LAUREL.

BAYLE, bēl, PIERRE (1647-1706). A French philosopher and critic. He was the author of a famous *Historical and Critical Dictionary* (*Dictionnaire historique et critique*), which passed through eight editions in 40 years (1697, 1702, 1715, 1720, 1730, 1734, 1738, 1740), and was twice translated into English (1710, 1734-37). He was born at Carla, near Foix, Nov. 18, 1647, of a Protestant family, studied at Puy-Laurens and Toulouse, and showed the critical balance of his mind by professing Catholicism in 1669 and Protestantism in 1670. He taught for a time in Geneva and in 1675 became professor of philosophy at the Protestant Academy of Sedan. On its suppression (1681) Bayle sought intellectual freedom in Holland and settled at Rotterdam, where he received a salary from the municipality as an unattached professor of philosophy. He now published his first important work, the sensational *Pensées sur la comète*, and a *Critique générale sur l'histoire du Calvinisme du Père Maimbourg* (1682), somewhat antiquated in style, but in thought a full generation in advance of his countrymen. In 1684 he began to publish a literary magazine, *Nouvelles de la république des lettres*, and greeted the revocation of the Edict of Nantes in two pamphlets, *Ce que c'est que la France toute catholique sous le règne de Louis le Grand*, and a *Commentaire philosophique sur le Compelle Intrare* (1686), which were denounced for "preaching the dogma of religious indifference and universal toleration," alike by Protestants and by Catholics, and were disavowed ironically by Bayle, who had the courage of his convictions but not of their consequences. Such tactics, afterward imitated by Voltaire, make his authorship

of *Avis aux réfugiés* (1690) dubious, but in any case it intensified the opposition of Protestants, who now accused him of atheism, with the result that Bayle was deprived (1693) of his municipal pension and authority to teach in Rotterdam. This act he chose to attribute to his Cartesian philosophy, the ministers being, he said, "obstinate admirers of Aristotle."

Bayle now devoted himself wholly to compiling his Dictionary, originally as a work of pure erudition, to trace and rectify error in other works, though it became in the course of its compilation a destructive criticism of received history and systems, and so an arsenal of rationalism for the eighteenth century. The Dictionary makes no pretense to completeness, but it acquires a kind of unity through its constant insinuation that the teachings of reason contradict the dogmas of religion, and that the rational man, in forming his morality, will consider only himself. In the articles of the Dictionary, and still more in the notes to them, Bayle's humor delights in daring impieties and Rabelaisian obscenities, after the manner of his time. It popularized his work, but gave a handle to his enemies, who grew in number and virulence. To justify himself, he wrote four dissertations—*On Atheists*; *On Manichæans*; *On Obscenities*; and *On Pyrrhonists*; but his last work—*Réponse aux questions d'un provincial* (1703) and *Continuation des pensées sur la comète* (1704)—showed that he still thought it, in his own words, "in no wise sure that the impressions of nature are to be accepted as the expressions of truth." He died at Rotterdam, Dec. 28, 1706. Bayle's private life was dignified and disinterested. His libertinism was wholly intellectual. His ideas and spirit penetrate like yeast the whole eighteenth century. Bayle's *Works* (4 folios, 1727–31, reprinted with additions, 1737) contains his interesting *Correspondence*. There is an annotated edition of the *Dictionnaire* in 16 vols. (Paris, 1820), and a *Selection of Unpublished Correspondence* (*Choix de la correspondance inédite*, Copenhagen, 1890). Consult Desmaizeaux, *La vie de Pierre Bayle* (The Hague, 1732), Feuerbach, *Pierre Bayle* (Leipzig, 1848), and also Brunetière, *Études critiques* (5th series, 1893); Renouvier, *Philosophie analytique de l'histoire*, vol. iii (1897); Perrens, *Les libertins en France au XVII^e siècle* (1896); and A. Cazes, *Pierre Bayle: sa vie, ses idées, son influence, son œuvre* (Paris, 1905).

BAYLEN, bí-lán'. See BAILÉN.

BAYLEY, bá'li, JAMES ROOSEVELT (1814–77). An American prelate of the Roman Catholic church. He was born in New York, graduated at Washington (now Trinity) College, Hartford, was ordained a Protestant Episcopal clergyman, and for some time preached in New York. In 1842 he became a Roman Catholic, and two years later was ordained by Bishop Hughes. He served for a time as professor of belles-lettres and acting president of St. John's College, Fordham, N. Y., and was secretary to Bishop Hughes from 1846 to 1853, when he was consecrated Bishop of Newark, N. J. He founded Seton Hall College and many other institutions. In 1872 he was made Archbishop of Baltimore. He published a *History of the Roman Catholic Church on the Island of New York* (1853), *Pastorals for the People*, and the *Memoirs of Simon Gabriel Brute, First Bishop of Vincennes* (1860). He was much esteemed for his social as well as for his intellectual gifts.

BAYLEY, RICHARD (1745–1801). An American physician. He was born in Fairfield, Conn., studied in London hospitals, began to practice in New York in 1772, and in 1775–76 studied in England with Dr. John Hunter. Early in 1776 he returned to the United States as staff surgeon to Sir Guy Carleton. He lectured on surgery and published a work on croup, introducing a new and valuable method of treating that disease. In 1792 he became professor of anatomy and surgery in Columbia College. He was the first health officer of the port of New York and as such originated New York's quarantine laws.

BAYLEY, WILLIAM SHIRLEY (1861–). An American geologist, born in Baltimore, Md. He graduated from Johns Hopkins in 1883, was a fellow at that university for two years, and received the degree of Ph.D. in 1886. His earlier service was at Colby College, as professor of geology (1888–1904); his later, at the University of Illinois, first as assistant professor of geology (1907–09), and then as associate professor of mineralogy and economic geology (1909–). After acting for 21 years as assistant geologist in the United States Geological Survey he was made geologist in 1908. Several American and European scientific societies elected him to membership. Besides editing *The American Naturalist* (1886–1907), he contributed frequently to technical journals, prepared many geological reports, and wrote *Iron Mines and Mining in New Jersey* (1912).

BAYLISS, SIR WYKE (1835–1906). An English painter and writer on art. He was born at Madeley, and studied in the schools of the Royal Academy. He is known as one of the most prominent advocates of the Neo-Gothic revival; but his interesting pictures, which usually treat of church interiors, are of no great technical merit. They have often been exhibited in America. The best include "La Sainte Chapelle" (Royal Academy, 1865); "St. Mark's, Venice" (Nottingham, 1880); "St. Peter's, Rome" (1888); "The Golden Duomo" (Pisa, 1892). He succeeded Whistler as president of the Royal Society of British Artists in 1888. He wrote: *The Witness of Art* (1876); *The Higher Life in Art* (1879); *The Elements of Aerial Perspective* (1885); *Rex Regum: A Painter's Study of the Likeness of Christ* (1898); *Five Great Painters of the Victorian Era* (1902); *Seven Angels of the Renaissance* (1905).

BAYLOR, FRANCES COURTENAY (1848–). An American novelist, born at Fayetteville, Ark. In 1896 she married George S. Barnum. She first attracted attention by two short stories, *The Perfect Treasure* and *On This Side*, published together under the title *On Both Sides* (1886). Among her other novels are: *Claudia Hyde* (1894); *Nina Barrow* (1897); *The Ladder of Fortune* (1899); *A Georgian Bungalow* (1900). *Juan and Juanita* (1897) is a book for juvenile readers.

BAYLOR, ROBERT EMMET BLEDSOE (1793–1874). An American jurist, born in Lincoln Co., Ky. After serving in the War of 1812 he began the practice of law in Kentucky, but afterward removed to Alabama; was a member of Congress from that State from 1829 to 1831, and participated in the Creek War as commander of a volunteer regiment. He afterward removed to Texas, where he became one of the foremost advocates of the annexation of that republic to the United States, and was a member of the First Constitutional Convention. He

subsequently served as a district judge for 25 years. A Baptist college, chartered in 1845 by the Congress of Texas, received the name of Baylor University, in recognition of the liberal donation bestowed upon it by Judge Baylor.

BAYLOR UNIVERSITY. A Baptist educational institution. It was chartered in 1845 by the then Republic of Texas and was formerly situated at Independence, Tex., but removed to Waco in 1886. Its productive funds in 1913 amounted to \$200,000, with \$300,000 in notes in process of payment. Its library had 26,300 bound volumes. The faculty of the academy, college, and schools of fine arts, medicine, and pharmacy numbered 76, and the students of all departments 1531. President, S. P. Brooks.

BAYLY, bā'yī, ADA ELLEN. See LYALL, EDNA.

BAYLY, LEWIS (—1631). Bishop of Bangor, Wales. He was a native Welshman; was educated at Oxford, and enjoyed favor at court, but later lost it because of his puritan sympathies. He is now remembered only as the author of the *Practice of Piety*, the most popular religious book until Bunyan's work appeared. Bunyan attributed his first religious awakening to the reading of this book. Besides numerous editions of the original work, translations appeared in Welsh, French, German, Polish, and Romansch. John Eliot translated it into the Indian language as an aid in his mission work.

BAYLY, THOMAS HAYNES (1797–1839). An English poet. He was intended for holy orders and educated at Oxford. He inherited a large fortune, but lost it, and in 1831 began to write songs for music and, with Henry Bishop, published *Melodies of Various Nations*. Within a few years he wrote 36 dramatic pieces, a number of stories, and hundreds of songs. Some of the more popular were: "The Soldier's Tear"; "Why Don't the Men Propose?" "We met, 'Twas in a Crowd"; "I'd Be a Butterfly," etc. His best farce is *Perfection*. His fiction is represented by *The Aylmers*, a novel in 3 vols., and *Kindness in Women*, a collection of tales. Consult his *Works*, with memoir (London, 1844).

BAYNE, bān, PETER (1830–96). A Scottish author. He was educated in Marischal College, Aberdeen; studied theology at Edinburgh and philosophy under Sir William Hamilton. He wrote criticisms on Alison, De Quincey, Hugh Miller, and others. In 1855 he published *The Christian Life, Social and Individual*, which was followed in 1859 by *Essays, Bibliographical, Critical*, etc. He was editor of the *Glasgow Commonwealth*, *Edinburgh Witness*, and *London Dial*, and an associate editor of the *Christian World*. Among his other works are: *Testimony of Christ to Christianity* (1862); *The Days of Jezebel: An Historical Drama* (1872); *Life of Luther* (1887). He died in London, Feb. 10, 1896.

BAYNES, bānz, THOMAS SPENCER (1823–87). An English writer on philosophy. He was born at Wellington, Somerset; was educated at Bristol College and Edinburgh University and became assistant to Sir William Hamilton at the latter institution. He published an *Essay on the New Analytic of Logical Forms* (1852), an exposition of Hamilton's *Quantification of the Predicate*. From 1857 to 1863 he was one of the examiners for the University of London and assistant editor of the *Daily News*. In 1864 he became professor of logic, rhetoric, and metaphysics in the University of St. Andrews, where he remained till his death. He wrote much

for the *Edinburgh* and other reviews and magazines, and was editor of the ninth edition of the *Encyclopædia Britannica*.

BAY OF ISLANDS. 1. A bay on the north-east coast of North Island, New Zealand, in lat. 35° 14' S., long. 174° 11' E. (Map: New Zealand, N. I., B 1). 2. A bay on the west coast of Newfoundland, studded with many beautiful islands, with fisheries, timber, and deposits of marble and gypsum (Map: Newfoundland, B 3).

BAY OF NAPLES. See NAPLES, BAY OF.

BAYOMBONG, bā'yòm-bông'. The capital of the province of Nueva Vizcaya, on the island of Luzon, Philippines (Map: Philippine Islands, C 2). The town is situated on the Magat River, 134 miles north of Manila, and is the centre of a fertile district, producing rice and tobacco. Pop., 1903, 4039.

BAYONET (Fr. *baïonnette*, *bayonnette*, first made in Bayonne, France). A short dagger-like weapon of steel, constructed so that it may be fixed at the end of the rifle barrel, to which it is attached by a strong spring clasp, usually secured to the block of the foresight. When not so fixed, it is carried in a leather scabbard suspended from the waist belt on the left side of the body. The first bayonets, used in France in 1671, were known as *bayonets-à-manche* and had handles which fitted into the muzzles of the guns; the socket bayonets, or *bayonets-à-douille*, not being introduced until a later date. These latter permitted the piece to be fired without removing the bayonet. The dagger is said to have been the original bayonet; the musketeer of that day having utilized his dagger as a defense against charging cavalry by fitting the handle of his dagger into the muzzle of his musket. During the gradual evolution of the modern sword bayonet, which is now a weapon of offense rather than of defense, many experiments have been made in the attempt to introduce various forms of intrenching tools—knives, etc., constructed to serve also as bayonet; but such arrangements are nowhere in general use. Many authorities maintain that the bayonet, together with all other forms of the *arme blanche*, have become of very little, if comparatively any, importance in modern operations; while others, equally as positive, assert that it still retains decisive value. It is certainly true that long-range and rapid-fire rifles, together with smokeless powder, often seal the fate of a battle long before the bayonet can be brought into play; but there are still campaigns where the soldier armed with a bayonet has a considerable moral superiority over his opponents not so armed. The British-Egyptian campaigns of 1882–84 and 1886, the frontier expeditions in India, and the Boer War of 1899–1902 are cases in point. The best tactician in the world cannot always prevent, even with modern firearms, such things as surprises; and small bodies of men will still occasionally, under practically any conditions, be able to get unperceived into close quarters with their enemy. So long as night attacks are possible, just so long will the bayonet be of prime importance, for it is undoubtedly and invariably the weapon to be used. In every battle there are important positions which must be quickly taken by assault, and one of the principal lessons of the war in Manchuria is not to abandon the bayonet. See TACTICS, MILITARY; INFANTRY.

BAYONNE, bā-yôn', Fr. pron. bā'yôn' (Bay city, from Bisc. *baia*, *baïya*, harbor, Portug. *bahia*, Eng. *bay*). A cathedral town, and a for-

treas of the first class, in the department of the Basses-Pyrénées, France (Map: France, S., C 5). It stands $3\frac{1}{2}$ miles from the Bay of Biscay, at the confluence of the Nive and Adour, which rivers divide the city into Great and Little Bayonne, with which the Faubourg Saint-Esprit is connected by a bridge. The city is cheerful and pleasant, and the valley in which it lies is backed by the foothills of the Pyrenees. The harbor of Bayonne is safe and commodious, and has three lighthouses at its entrance. The noteworthy institutions consist of a library, a theological seminary, a museum, a military hospital, barracks, and a naval school. The cathedral was begun in 1213, and its corbels bear the arms of English princes of the occupation period. The spires are modern (nineteenth century). Bayonne has an extensive trade with Spain, Portugal, and South America, and sends masts and ship timber to Brest and other French ports. Other exports include wine, tars and resins, minerals, grain, chocolate, and the famous Bayonne hams. Its industries comprise the making of brandy, cream of tartar, chocolate, leather, linen goods, and the refining of sugar. Glass works, anchor foundries, and shipyards are also in active operation at Bayonne. Pop., 1901, 32,722; 1906, 26,488; 1911, 27,886. Bayonne is the ancient Lapurdum, the capital of the Tarbelli, and as early as the third century A.D. was a fortress and a commercial centre. In the Middle Ages it was important because of its trade, its whaling fleet, and its manufacture of leather and arms. It has sustained several sieges, offering successful resistance to allied Spanish and British troops in 1814.

BAYONNE, bā-yōn'. A city in Hudson Co., N. J., on New York and Newark bays, and on the Central of New Jersey, and the Lehigh Valley railroads (Map: New Jersey, D 2). It contains the former villages of Centerville, Bergen Point, Bayonne, Constable Hook, and Salterville (Pamrapo), and is separated from Jersey City by the Morris Canal. The city has a large public library and is one of the most important manufacturing cities in the State. It contains large coal-shipping docks, chemical, boiler, refining and smelting works, motor boats, structural iron, insulated wire, and silk factories, and the largest plants of the American Radiator Company and of the Standard Oil Company, the refineries of which are connected by pipe lines with New York, Philadelphia, Baltimore, Pittsburgh, Baton Rouge, etc. The Hudson County Boulevard passes through the city. Bayonne was separated from Bergen as a township in 1861, was chartered as a city in 1869, and rechartered in 1872. It is governed by a mayor, elected biennially, who appoints the board of education, the board of health and library trustees, and, with the concurrence of the council, the police department and sinking-fund commissioners. Pop., 1900, 32,722; 1910, 55,545.

BAYONNE DECREE'. A decree issued by Napoleon on April 17, 1808, under pretense of helping the United States to enforce the embargo of 1807, directing the seizure and sale of all vessels flying the American flag which should subsequently enter the ports of France, Spain, Italy, and the Hanse towns, on the ground that such vessels would either be sailing under false colors or would be violating the laws of the United States and indirectly serving the cause of England. In accordance with this decree it is estimated that France confiscated over 300

American vessels, which she sold for the benefit of her national treasury. See **CONTINENTAL SYSTEM**.

BAYOU, bí'oo (N. Am. Indian *bayuk*, like a canal). A stream not fed with springs, but running from one body of water to another. Tidal channels in the States on the Gulf of Mexico often bear this name.

BAYOU STATE. The name popularly given to the State of Mississippi, from the number of small creeks or bayous within its limits. See **STATES, POPULAR NAMES OF**.

BAY PSALM BOOK. The first book published in the American Colonies, the joint product of Richard Mather, founder of that distinguished family of New England divines, of Thomas Welde, and of John Eliot, the missionary to the Indians. It was printed by Stephen Daye, at Cambridge, in 1640, and after revision in 1647 remained in general use for many years. It is hard to realize how it can have ministered to edification, for it outdid Sternhold and Hopkins in harsh crudity of style, metre, and rhythm. Yet it was the product of university men. Mather had been a student at Oxford; John Eliot was a graduate of Cambridge. They must have served their apprenticeship there at Latin verse making, and it is incredible that they should not have been able to write better English verse. But they were determined that the Lord's praises should be sung according to His own will, and with their ideas of literal biblical inspiration they were willing to sacrifice every element of poetry to what they imagined was faithfulness to Hebrew originals. They tell us in their preface that they "attempted conciseness rather than elegance, fidelity rather than poetry." That they thought these qualities contradictory illustrates the fatal flaw in Puritan aesthetics. How numbing this moral discipline had been to the harmonies and amenities of life may be judged from the fact that few congregations knew more than five tunes, and but 10 are known to have been used in the first half-century of the *Bay Psalm Book's* existence. Consult Trent, *American Literature* (New York, 1903).

BAYREUTH, bí'roit, or **BAIREUTH** (Lat. *Baruthum*). The capital of the government district of Upper Franconia, Bavaria, formerly the capital of the principality of the same name, ruled by Margraves of the house of Hohenzollern (Map: German Empire, D 4). It is beautifully situated on the Red Main, 126 miles north of Munich. The streets are broad and well paved and its principal buildings are the Wagner Theatre; the old palace; the new palace, containing a gallery of paintings; the old opera house; a riding school; the infirmary; and the townhall. Among the interesting private houses are the Villa Wahnfried, the former residence of Richard Wagner, who is buried in its grounds, and the house of Jean Paul Richter. In the Central Cemetery are the graves of Jean Paul Richter and the composer Franz Liszt. Bayreuth has numerous educational and charitable institutions. There are manufactures of cotton and woolen goods, sewing machines, leather, earthenware, and agricultural and musical instruments. There are also breweries, distilleries, and brick kilns. Pop., 1900, 29,384; 1905, 31,861; 1910, 34,547. This town is popularly known as the mecca of the Wagnerites. In 1872, partly from funds collected from patrons and partly by the organization of so-called Wagner societies, there was begun the erection of a theatre for the production

of Wagner's works. It was opened in 1876, and since then music lovers have been attracted to Bayreuth from all over the world. The theatre occupies a site on a hill overlooking the town and is reached by a broad avenue of shade trees. In connection with the theatre is a school for the training of voices to participate in the Wagner festivals. Consult Meyer, *Das Stadtbuch von Baireuth* (München, 1896), and Jones, "Bayreuth and the Wagner Festival," in *Cassel's Magazine*, vol. xxvii (London, 1899); Bahr-Mildenburg and Bahr, *Bayreuth and the Wagner Theatre* (London, 1912).

BAYREUTH MUSICAL FESTIVAL. The Festival Theatre of Bayreuth has been described as the musical shrine of Richard Wagner. The building of the Festival Theatre had been the dream of Wagner's life, and eventually he was fortunate enough to secure the interest of the unhappy King Ludwig II of Bavaria, from whom and through whom he secured much financial assistance, which, with the subscriptions received from lovers of his music, enabled him to carry out his long-cherished scheme. The idea was first conceived in 1858, and the *Tetralogy of the Nibelungen* written, composed, and reserved until there should have been materialized the conditions and environments which its creator deemed necessary for its proper presentation. The situation of the theatre has been admirably chosen, with the town of Bayreuth in the foreground and the hills of Franconia for a background. Performances begin at 4 P.M. except when the *Rheingold* is given, when the hour is altered to 5 P.M. The artists, who invariably give their services, carry out as far as possible Wagner's directions and ideas. They never recognize the plaudits of the audience, and as far as possible discourage ebullitions of feeling on the part of their auditors. Originally the audience remained silent throughout every performance; but this rule is now seldom obeyed except in the solitary instance of *Parsifal*. In order to secure every possible artistic reinforcement, the orchestra is hidden away out of sight under the stage; and the auditorium itself is plunged into darkness before and after each act. On May 22, 1872, the foundation stone was laid, the event being marked by the performance of Beethoven's *Ninth Symphony*, with an orchestra of 500 instruments, comprising many of the greatest instrumentalists of the day, among whom were Wilhelmj (q.v.), playing a first-violin part, and Hans Richter, with the tympani. The theatre was opened in 1876 with *Der Ring des Nibelungen*, the festival continuing from August 13 to August 17. The next festival occurred in 1882, when *Parsifal* had its first presentation; since which event performances have been given almost every year. The festival of 1897 was especially remarkable as being the first time five complete works were given, the *Tetralogy* and *Parsifal*. To Frau Wagner and Siegfried Wagner, wife and son of the master, is mainly due the credit of maintaining intact, as far as possible, the traditions of the Bayreuth Festival. See MUSIC FESTIVAL.

BAYRHOFER, bir'höf'fēr, KARL THEODOR (1812-88). A German-American philosopher and publicist, from 1838 to 1846 professor of philosophy in the University of Marburg. He became a member of the Diet of Hesse-Cassel in 1848, and in 1850 was President of the Chamber. After the defeat of his party (the Democratic) he came to America in 1853 and settled in Wis-

consin as a farmer, though from 1866 he lived principally by his pen. In his early writings, notably in *Idea and History of Philosophy* (1838), he appears as a zealous disciple of Hegel. Afterward he became a champion of German Catholicism and wrote *Researches into the Essence, History, and Criticism of Religion* (1840).

BAY RUM. An aromatic liquid prepared by mixing oil of bay with alcohol and water and adding small quantities of oil of orange peel and oil of pimenta. Oil of bay is obtained by distilling the leaves of the *Myrcia acris*, a West Indian tree belonging to the natural order Myrtaceæ.

BAY SAINT LOUIS, *Fr. Creole pron.* bā sūn lōō'e'. A city and the county-seat of Hancock Co., Miss., 53 miles by rail east by north of New Orleans, La.; on Mississippi Sound, the Jordan River, and on the Louisville and Nashville Railroad (Map: Mississippi, G 10). It is a popular watering place, a notable attraction being a fine shell road along the beach. The city contains St. Stanislaus College and the St. Joseph Convent. Its leading industries are fishing, oyster cultivation, and canning, fruit growing, and truck gardening. Pop., 1890, 1974; 1900, 2872; 1910, 3338.

BAY SALT. A name applied to common salt which is obtained from sea water by solar evaporation. Such salt is obtained from salt marshes which exist along the coast of France, on the shores of the Mediterranean, and in the West Indies. It is an inferior grade, useful for limited purposes.

BAY STATE. A popular name for the State of Massachusetts, given because previous to the adoption of the Federal Constitution it was called the Massachusetts Bay Colony. See STATES, POPULAR NAMES OF.

BAY WINDOW, or (corruptly) **BOW WINDOW**. A window first generally used in late civil Gothic architecture, so called because it forms a bay (q.v.) or projecting section of a room. Bay windows are, for the most part, either rectangular or polygonal in plan, the semicircular form from which the term *bow* was probably derived having been unknown before the latest form of Gothic. Bay windows generally reach to the floor, and are frequently supplied with a seat, which is called the "bay stall." There are many very beautiful examples in the colleges and halls of Oxford and Cambridge, as well as in the great feudal mansions. When used in upper stories and supported on corbels, such windows are called "Oriel windows" (q.v.).

BAZA, bā'thā (the *Basti* of the Romans). A town in Spain, situated near the river Baza, in the province of Granada, about 50 miles east-northeast of the city of that name (Map: Spain, D 4). It lies in a rich plain and is engaged in the production of wine, grain, fruit, oil, etc. There are manufactures of leather, fabrics, pottery, and sombreros, and flour and oil mills. Baza contains several fine churches, including the collegiate church of San Máximo. Pop., 1900, 12,770; 1910, 15,964. Under the Mohammedans Baza was a lively centre of trade and had 50,000 inhabitants. Isabella of Castile reduced the city after a seven-months siege in 1489. In 1810 the Spaniards were defeated here by the French under Marshal Soult.

BAZA. A wild negro people in upper Nubia; with neighboring tribes they are called Shaggallas by the Abyssinians.
